OVERVIEW

This supplementary information presents a summary of population and distributional data for the 71 taxa included in the risk assessment of the impact of fishing-related mortalities on seabirds breeding in the New Zealand region.

For each seabird taxon included in the risk assessment, the demographic parameters used were the New Zealand population size, the age at first reproduction, and the survival rate. These data are included here with an assigned index of quality (poor, medium, high). For species for which no demographic estimates were available, values from proxy species were used, as indicated with a reference to the data source. Distributional data are presented as maps of the at-sea distribution of each species, with separate maps for the non-breeding and breeding distributions. The distribution of non-breeders was derived from existing maps published by NABIS (National Aquatic Biodiversity Information System) and BirdLife International. A single distribution map was generated when the breeding season extended throughout the year. Included in the distributional maps are data of any incidental captures in commercial trawl, longline and set-net fisheries between the 2006–07 and 2014–15 fishing years, recorded by fisheries observers.

The derived parameters as used in the calculations for the risk assessment are also included. Included with each derived parameter is the density distribution, with the red line indicating the mean, and blue lines indicating the 2.5 and 97.5 percentiles. A detailed description of the methods used to derive the data presented here is provided in the main document.

1. SPECIES DATA

1.1 Gibson's albatross (*Diomedea antipodensis gibsoni*)

Table 1: Raw input data of population parameters of Gibson's albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment.

| Parameter | Data | Reference | Quality |
|---------------------------|--|--|---------|
| Population (NZ) | 4 792 pairs [2014] | Elliott & Walker (2014), Baker & Jensz (2014) | High |
| Age at first reproduction | 10 to 12 years | de L. Brooke (2004) | |
| Current survival rate | 96 to 98 % [1997] 93.8 to 98.5 % [1996] $95.9 \pm 0.6 \%$ [2004] | Walker & Elliott (1999) Croxall & Gales (1998) Agreement on the Conservation of Albatrosses and Petrels (2010) | Medium |
| Optimal survival rate | 96 to 98 % [1997] 93.8 to 98.5 % [1996] $95.9 \pm 0.6 \%$ [2004] | Walker & Elliott (1999) Croxall & Gales (1998) Agreement on the Conservation of Albatrosses and Petrels (2010) | Medium |
| Body mass | 8 017 g | Myhrvold et al. (2015) | |
| Breeding period | All year | G. Taylor (pers. comm.) | |

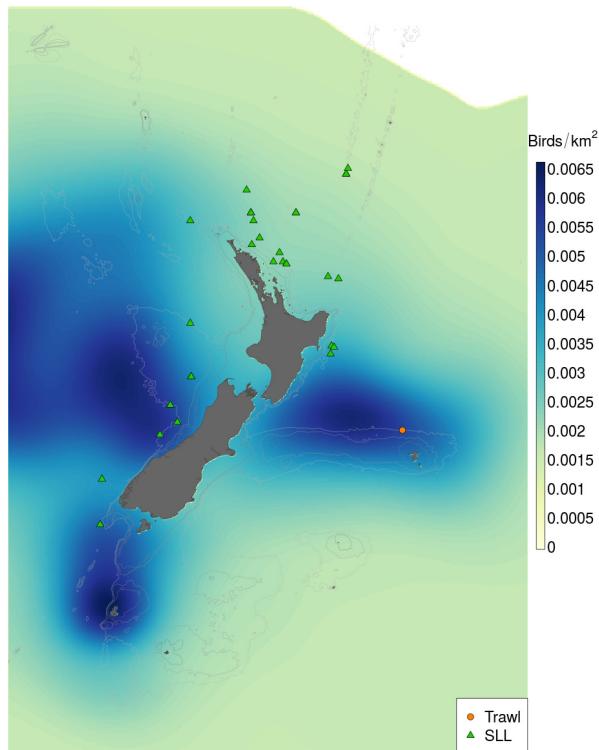

Figure 1: Relative density of Gibson's albatross (*Diomedea antipodensis gibsoni*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl and surface-longline (SLL) fisheries.

Table 2: Derived values of population parameters of Gibson's albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 11.0 | 10.1–12.0 | Years |  |
| Age at first reproduction (from allometric model) | 11.1 | 9.2–13.2 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 96.2 | 93.9–98.4 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 96.1 | 93.9–98.4 | % |  |
| Optimal adult annual survival rate (from allometric model) | 95.9 | 94.6–97.0 | % |  |
| Proportion of adults breeding (from raw input parameters) | 59.9 | 50.2–69.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 4 810 | 3 940–5 820 | Pairs |  |
| Total population size (from raw input parameters) | 42 900 | 29 600–62 800 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.046 | 0.039–0.054 | |  |

1.2 Antipodean albatross (*Diomedea antipodensis antipodensis*)

Table 3: Raw input data of population parameters of Antipodean albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment.

| Parameter | Data | Reference | Quality |
|---------------------------|-------------------------|-------------------------|---------|
| Population (NZ) | 3 320 pairs [2014] | G. Elliot (pers. comm.) | High |
| Age at first reproduction | 10 to 13 years [1997] | Walker & Elliott (2002) | |
| Current survival rate | $95.7 \pm 0.7\%$ [2004] | Walker & Elliott (1999) | High |
| Optimal survival rate | $95.7 \pm 0.7\%$ [2004] | Walker & Elliott (1999) | High |
| Body mass | 8 017 g | Myhrvold et al. (2015) | |
| Breeding period | All year | G. Taylor (pers. comm.) | |

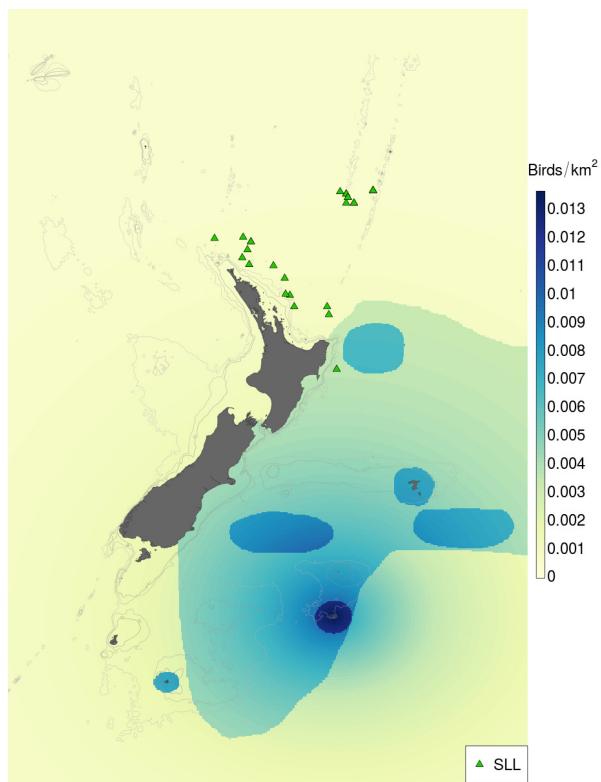

Figure 2: Relative density of Antipodean albatross (*Diomedea antipodensis antipodensis*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in surface-longline (SLL) fisheries.

Table 4: Derived values of population parameters of Antipodean albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 11.5 | 10.1–12.9 | Years |  |
| Age at first reproduction (from allometric model) | 11.1 | 9.2–13.4 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 95.6 | 94.1–96.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 95.6 | 94.1–96.9 | % |  |
| Optimal adult annual survival rate (from allometric model) | 96.0 | 94.6–97.1 | % |  |
| Proportion of adults breeding (from raw input parameters) | 59.9 | 50.4–69.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 3 330 | 2 690–4 040 | Pairs |  |
| Total population size (from raw input parameters) | 31 500 | 22 900–42 600 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.046 | 0.039–0.055 | |  |

1.3 Southern royal albatross (*Diomedea epomophora*)

Table 5: Raw input data of population parameters of southern royal albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment.

| Parameter | Data | Reference | Quality |
|---------------------------|-------------------------|---|---------|
| Population (NZ) | 7 886 pairs [2008] | Agreement on the Conservation of Albatrosses and Petrels (2010) | High |
| Age at first reproduction | 8.5 to 10.6 years | Robertson (1993) | |
| Current survival rate | $94.9 \pm 0.8\%$ [2001] | Agreement on the Conservation of Albatrosses and Petrels (2010) | High |
| Optimal survival rate | $94.9 \pm 0.8\%$ [2001] | Agreement on the Conservation of Albatrosses and Petrels (2010) | High |
| Body mass | 8 218 g | Myhrvold et al. (2015) | |
| Breeding period | All year | G. Taylor (pers. comm.) | |

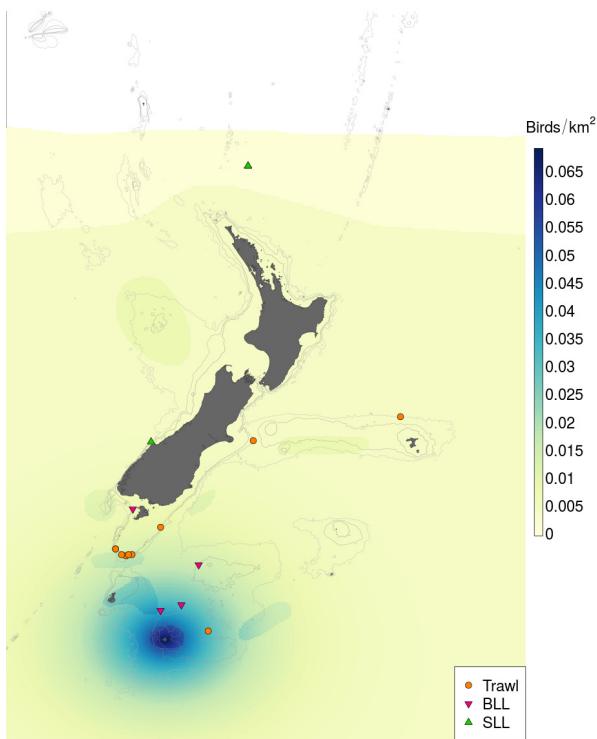

Figure 3: Relative density of southern royal albatross (*Diomedea epomophora*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), and bottom-longline (BLL) fisheries.

Table 6: Derived values of population parameters of southern royal albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 9.6 | 8.5–10.5 | Years |  |
| Age at first reproduction (from allometric model) | 11.2 | 9.3–13.4 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 94.9 | 93.1–96.3 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 94.9 | 93.2–96.3 | % |  |
| Optimal adult annual survival rate (from allometric model) | 96.0 | 94.6–97.1 | % |  |
| Proportion of adults breeding (from raw input parameters) | 60.0 | 50.2–69.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 7 930 | 6 540–9 490 | Pairs |  |
| Total population size (from raw input parameters) | 73 800 | 54 100–98 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.046 | 0.039–0.054 | |  |

1.4 Northern royal albatross (*Diomedea sanfordi*)

Table 7: Raw input data of population parameters of northern royal albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment.

| Parameter | Data | Reference | Quality |
|---------------------------|-------------------------|---|---------|
| Population (NZ) | 5 832 pairs [2003] | Agreement on the Conservation of Albatrosses and Petrels (2010) | |
| Age at first reproduction | 8.5 to 10.6 years | Robertson (1993) | |
| Current survival rate | $94.6 \pm 1.5\%$ [1993] | Agreement on the Conservation of Albatrosses and Petrels (2010) | High |
| | 95.2 % [1993] | Agreement on the Conservation of Albatrosses and Petrels (2010) | |
| Optimal survival rate | $94.6 \pm 1.5\%$ [1993] | Agreement on the Conservation of Albatrosses and Petrels (2010) | High |
| | 95.2 % [1993] | Agreement on the Conservation of Albatrosses and Petrels (2010) | |
| Body mass | 7 943 g | Myhrvold et al. (2015) | |
| Breeding period | All year | G. Taylor (pers. comm.) | |

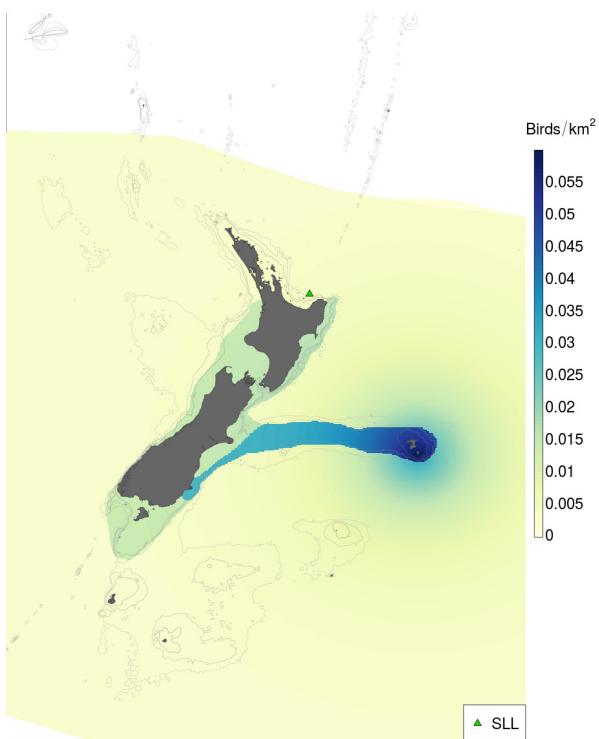

Figure 4: Relative density of northern royal albatross (*Diomedea sanfordi*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in surface-longline (SLL) fisheries.

Table 8: Derived values of population parameters of northern royal albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

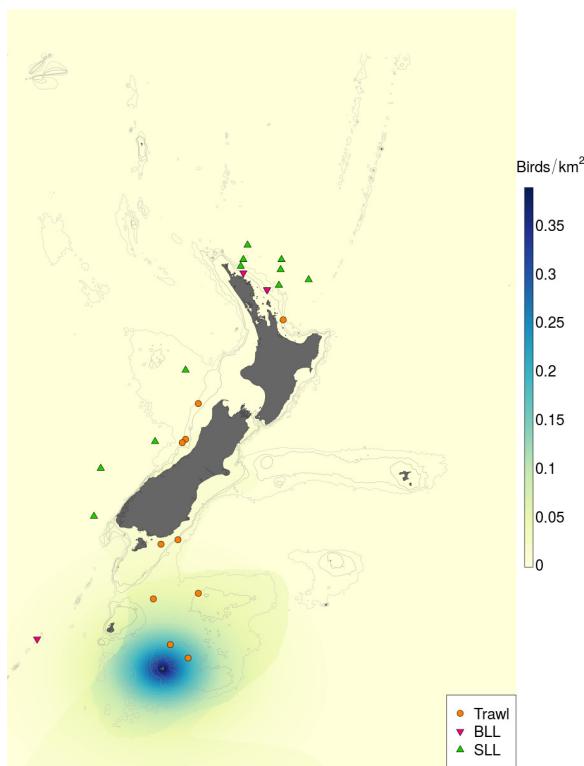

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 9.6 | 8.5–10.5 | Years |  |
| Age at first reproduction (from allometric model) | 11.1 | 9.1–13.3 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.8 | 91.0–96.7 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.8 | 91.0–96.7 | % |  |
| Optimal adult annual survival rate (from allometric model) | 95.9 | 94.6–97.0 | % |  |
| Proportion of adults breeding (from raw input parameters) | 60.9 | 51.0–70.0 | % |  |
| Annual breeding pairs (from raw input parameters) | 6 050 | 3 190–10 500 | Pairs |  |
| Total population size (from raw input parameters) | 61 800 | 30 400–114 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.046 | 0.039–0.055 | |  |

1.5 Campbell black-browed albatross (*Thalassarche impavida*)

Table 9: Raw input data of population parameters of Campbell black-browed albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-------------------------|---|---------|
| Population (NZ) | 21 000 pairs [1998] | Agreement on the Conservation of Albatrosses and Petrels (2010) | |
| Age at first reproduction | 10 (6–13) years [1995] | Waugh et al. (1999) | High |
| Current survival rate | $94.5 \pm 0.7\%$ [1996] | Agreement on the Conservation of Albatrosses and Petrels (2010) | |
| Optimal survival rate | $94.5 \pm 0.7\%$ [1996] | Agreement on the Conservation of Albatrosses and Petrels (2010) | |
| Body mass | 3 479 g | Myhrvold et al. (2015) | |
| Breeding period | August–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 50% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

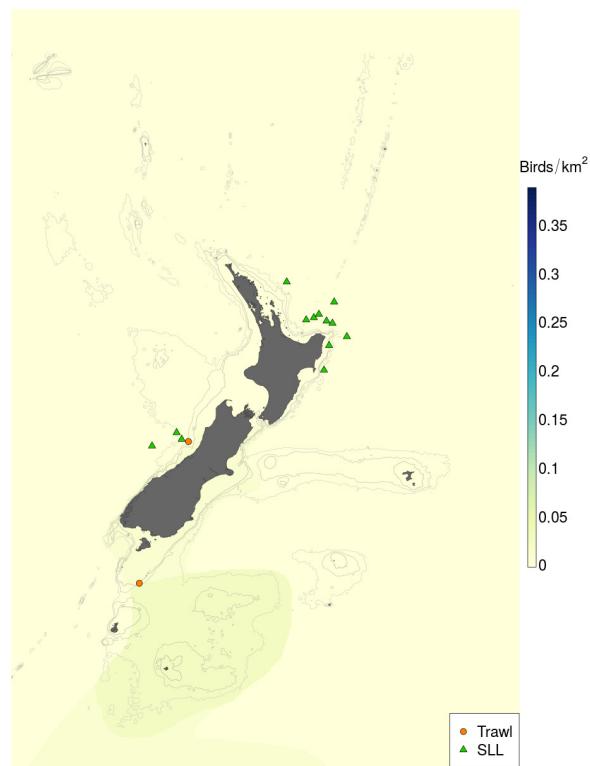

Figure 5: Relative density of Campbell black-browed albatross (*Thalassarche impavida*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), and bottom-longline (BLL) fisheries.

Table 10: Derived values of population parameters of Campbell black-browed albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

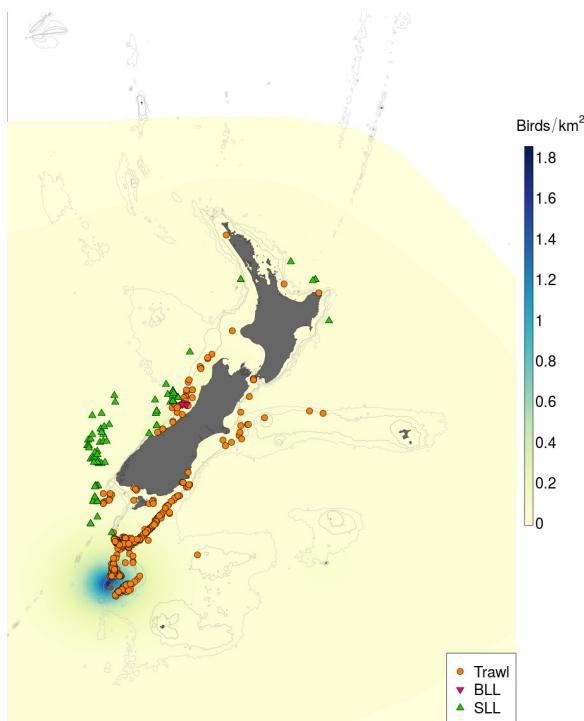

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 9.5 | 6.2–12.8 | Years |  |
| Age at first reproduction (from allometric model) | 9.0 | 7.8–10.3 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 94.5 | 93.0–95.7 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 94.4 | 92.9–95.7 | % |  |
| Optimal adult annual survival rate (from allometric model) | 95.0 | 93.8–96.1 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.3–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 22 000 | 11 800–38 300 | Pairs |  |
| Total population size (from raw input parameters) | 136 000 | 70 700–246 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.058 | 0.051–0.066 | |  |

1.6 New Zealand white-capped albatross (*Thalassarche cauta steadi*)

Table 11: Raw input data of population parameters of New Zealand white-capped albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---|--|---------|
| Population (NZ) | 95 701 (95% c.i.: 85 350 – 106 338) pairs | Richard et al. (2015) | High |
| Age at first reproduction | 12 years [2011] | Southern Buller’s albatross as proxy; Francis & Sagar (2012) | |
| Current survival rate | 96 % [2011] | Francis (2012) | High |
| Optimal survival rate | 96 % [2011] | Francis (2012) | High |
| Body mass | 3 900 (3 400–4 400) g | Sagar (2013) | |
| Breeding period | November–August | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 50% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

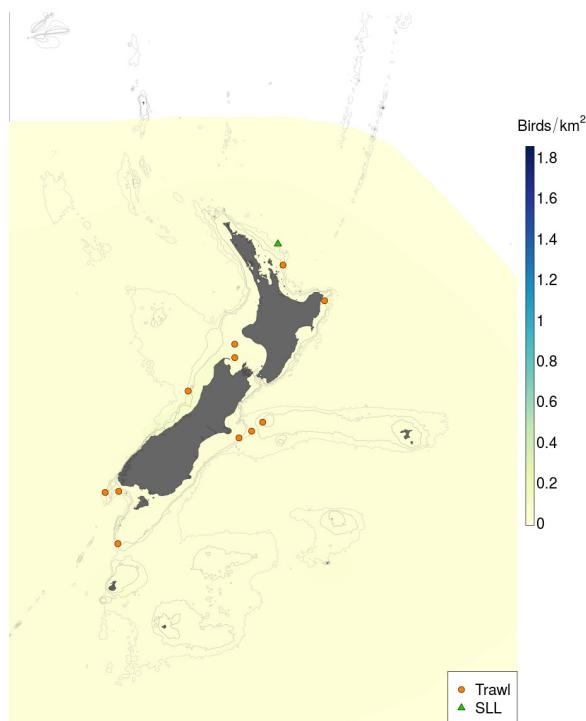

Figure 6: Relative density of New Zealand white-capped albatross (*Thalassarche cauta steadi*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), and bottom-longline (BLL) fisheries.

Table 12: Derived values of population parameters of New Zealand white-capped albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

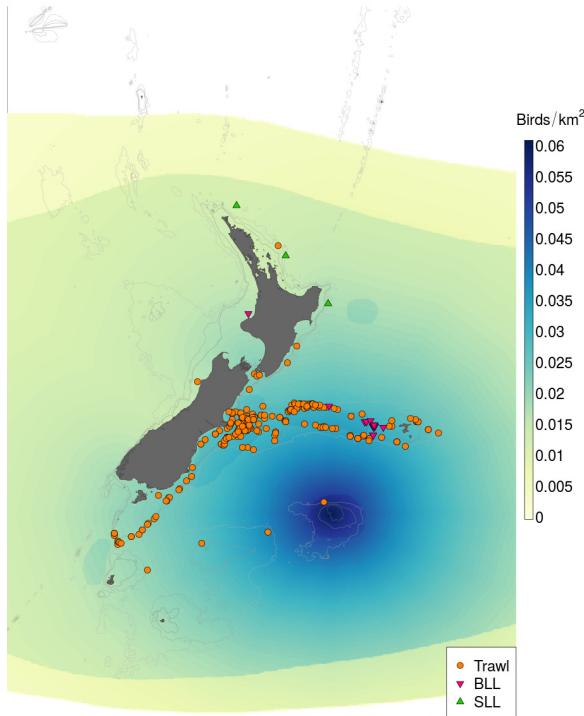

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 12.1 | 9.2–14.9 | Years |  |
| Age at first reproduction (from allometric model) | 9.2 | 7.9–10.7 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 95.9 | 93.5–97.5 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 95.9 | 93.6–97.5 | % |  |
| Optimal adult annual survival rate (from allometric model) | 95.1 | 93.9–96.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 67.7 | 57.5–76.8 | % |  |
| Annual breeding pairs (from raw input parameters) | 95 700 | 85 400–106 000 | Pairs |  |
| Total population size (from raw input parameters) | 775 000 | 563 000–1 080 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.056 | 0.049–0.065 | |  |

1.7 Salvin's albatross (*Thalassarche salvini*)

Table 13: Raw input data of population parameters of Salvin's albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-------------------------------|---|---------|
| Population () | 41 004 to 41 958 pairs [2014] | Baker et al. (2014, 2015) | High |
| Age at first reproduction | 12 years [2011] | Southern Buller's albatross as proxy; Francis & Sagar (2012) | |
| Current survival rate | 96.7 % [2011] | Sagar et al. (2011) | High |
| Optimal survival rate | 96.7 % [2011] | Sagar et al. (2011) | High |
| Body mass | 3 874 g | Myhrvold et al. (2015) | |
| Breeding period | September–April | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 10% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

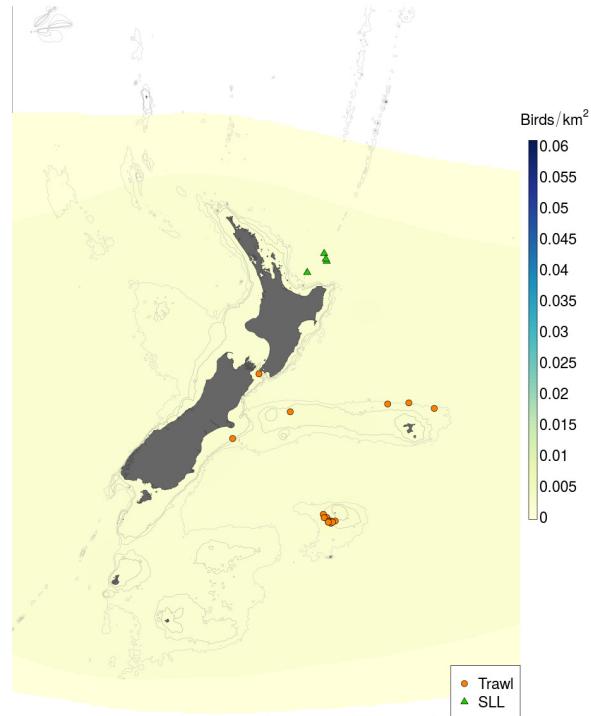

Figure 7: Relative density of Salvin's albatross (*Thalassarche salvini*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), and bottom-longline (BLL) fisheries.

Table 14: Derived values of population parameters of Salvin's albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

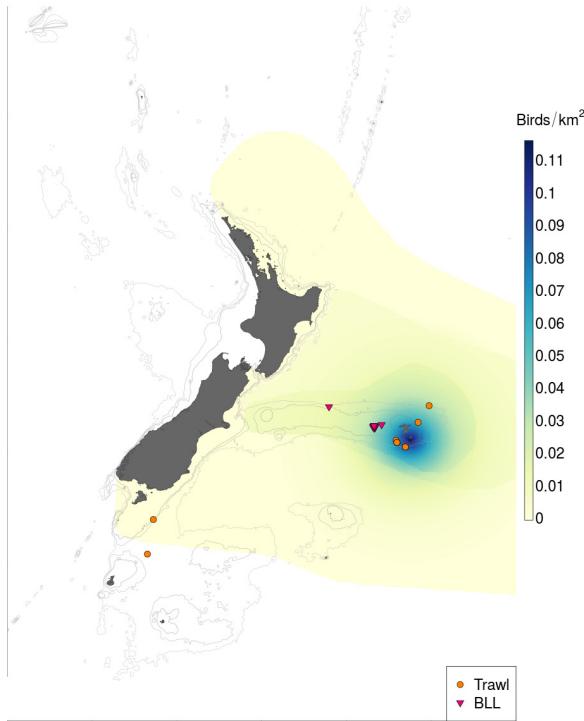

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 12.0 | 9.1–14.9 | Years |  |
| Age at first reproduction (from allometric model) | 9.2 | 8.0–10.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 96.6 | 94.1–98.2 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 96.6 | 94.1–98.2 | % |  |
| Optimal adult annual survival rate (from allometric model) | 95.1 | 93.9–96.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.2–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 41 500 | 41 000–41 900 | Pairs |  |
| Total population size (from raw input parameters) | 255 000 | 202 000–344 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.056 | 0.049–0.065 | |  |

1.8 Chatham Island albatross (*Thalassarche eremita*)

Table 15: Raw input data of population parameters of Chatham Island albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|--|---------|
| Population () | 5 245 pairs [2011] | Fraser et al. (2011) | High |
| Age at first reproduction | 12 years [2011] | Southern Buller's albatross as proxy; Francis & Sagar (2012) | |
| Current survival rate | 96.7 % [2011] | Salvin's albatross as proxy; Sagar et al. (2011) | |
| Optimal survival rate | 96.7 % [2011] | Salvin's albatross as proxy; Sagar et al. (2011) | |
| Body mass | 3 874 g | Myhrvold et al. (2015) | |
| Breeding period | August–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 2.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

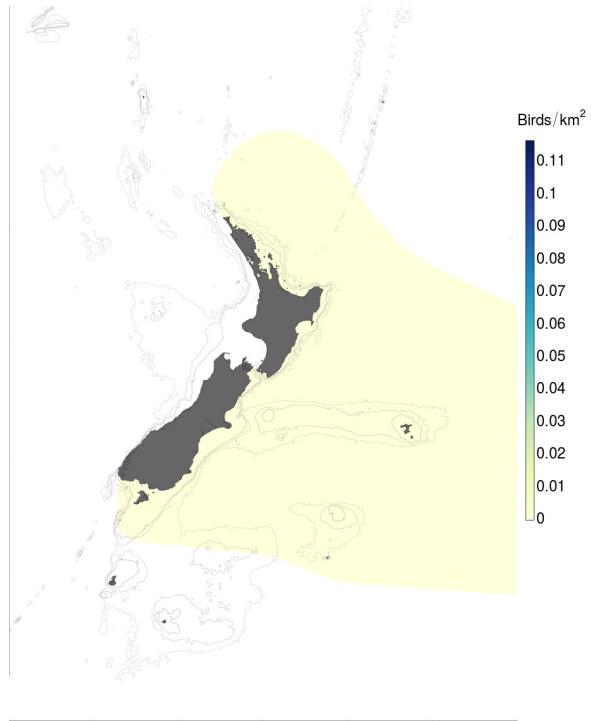

Figure 8: Relative density of Chatham Island albatross (*Thalassarche eremita*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl and bottom-longline (BLL) fisheries.

Table 16: Derived values of population parameters of Chatham Island albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

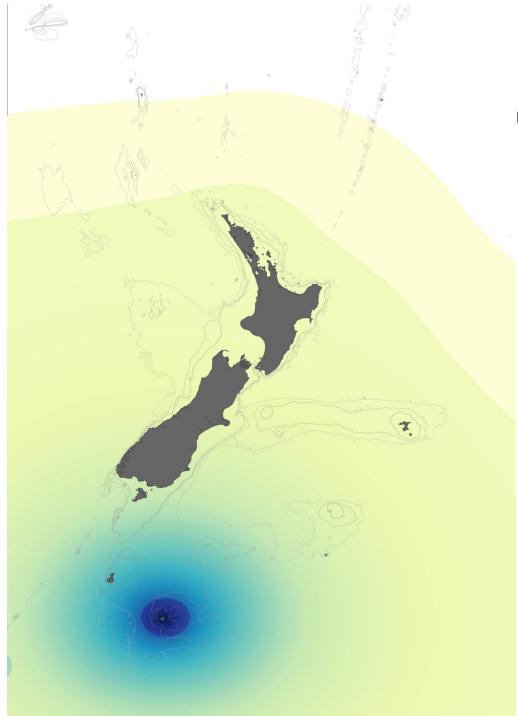

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 12.0 | 9.2–14.8 | Years |  |
| Age at first reproduction (from allometric model) | 9.2 | 7.9–10.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 96.6 | 94.0–98.2 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 96.6 | 94.1–98.2 | % |  |
| Optimal adult annual survival rate (from allometric model) | 95.1 | 93.9–96.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.7–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 5 280 | 4 300–6 400 | Pairs |  |
| Total population size (from raw input parameters) | 30 100 | 21 600–43 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.056 | 0.049–0.064 | |  |

1.9 Grey-headed albatross (*Thalassarche chrysostoma*)

Table 17: Raw input data of population parameters of grey-headed albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------------------------|---|---------|
| Population (NZ) | 6 600 pairs [1997] | Agreement on the Conservation of Albatrosses and Petrels (2010) | |
| Age at first reproduction | 7 to 13 years | Schreiber & Burger (2001) | |
| Current survival rate | $95.3 \pm 0.9\% (N = 225)$ [1996] | Waugh et al. (1999) | High |
| Optimal survival rate | $95.3 \pm 0.9\% (N = 225)$ [1996] | Waugh et al. (1999) | High |
| Body mass | 3 792 g | Myhrvold et al. (2015) | |
| Breeding period | September–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 20% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

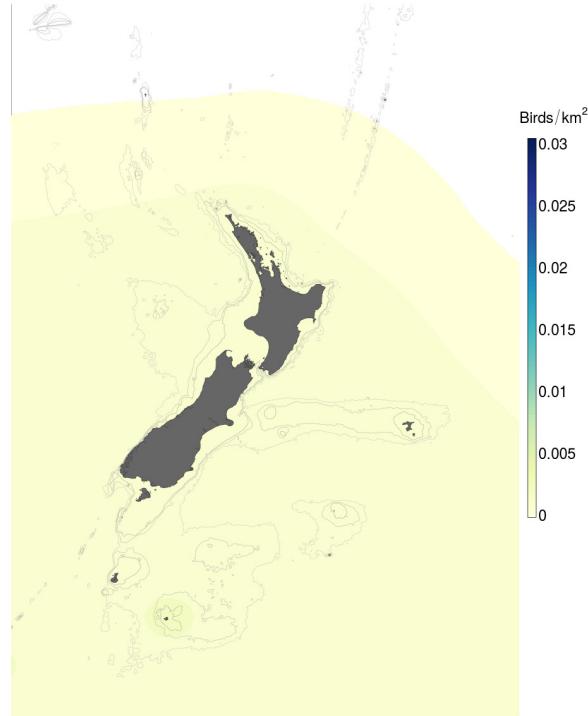

Figure 9: Relative density of grey-headed albatross (*Thalassarche chrysostoma*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 18: Derived values of population parameters of grey-headed albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

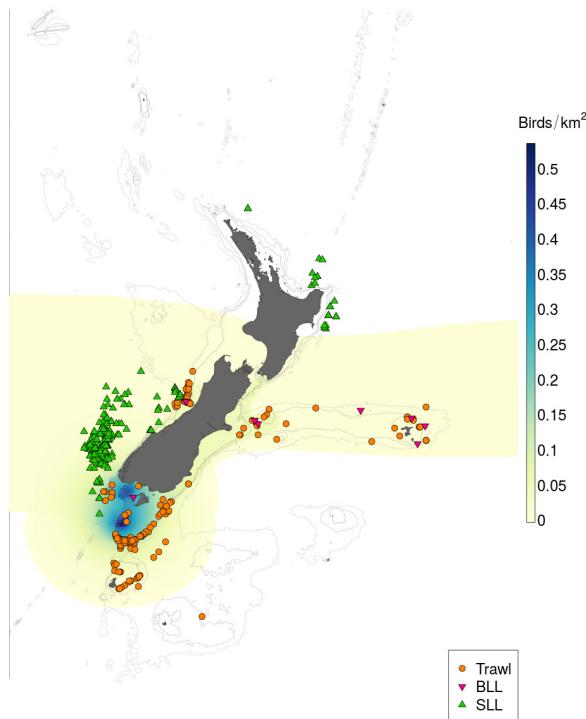

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 10.0 | 7.1–12.8 | Years |  |
| Age at first reproduction (from allometric model) | 9.2 | 7.9–10.5 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 95.2 | 93.2–96.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 95.2 | 93.1–96.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 95.1 | 93.9–96.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 74.8 | 64.0–83.8 | % |  |
| Annual breeding pairs (from raw input parameters) | 6 900 | 3 710–11 800 | Pairs |  |
| Total population size (from raw input parameters) | 49 000 | 25 400–86 700 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.057 | 0.050–0.065 | |  |

1.10 Southern Buller's albatross (*Thalassarche bulleri bulleri*)

Table 19: Raw input data of population parameters of southern Buller's albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------|-------------------------|---------|
| Population (NZ) | 13 625 pairs [2002] | Sagar & Stahl (2005) | High |
| Age at first reproduction | 12 years [2011] | Francis & Sagar (2012) | High |
| Current survival rate | 93 to 98 % [2011] | Francis & Sagar (2012) | High |
| Optimal survival rate | 93 to 98 % [2011] | Francis & Sagar (2012) | High |
| Body mass | 2 837 g | Myhrvold et al. (2015) | |
| Breeding period | December–August | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 2.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

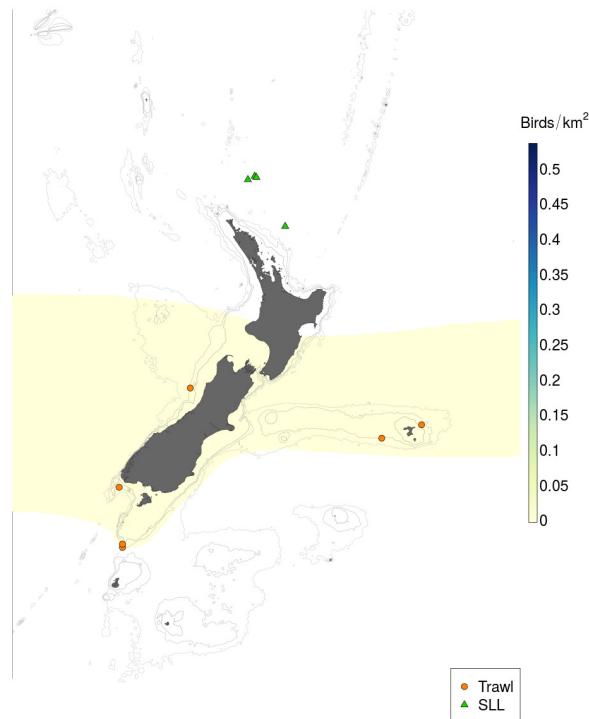

Figure 10: Relative density of southern Buller's albatross (*Thalassarche bulleri bulleri*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), and bottom-longline (BLL) fisheries.

Table 20: Derived values of population parameters of southern Buller's albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

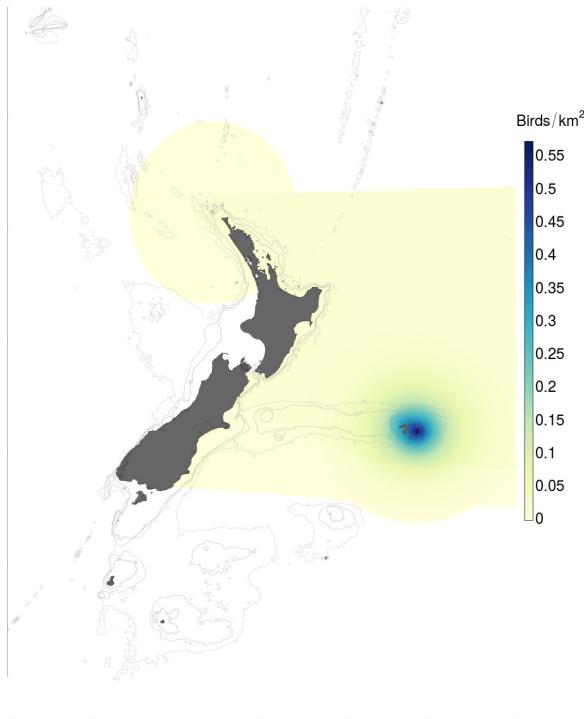

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 12.0 | 9.2–14.8 | Years |  |
| Age at first reproduction (from allometric model) | 8.5 | 7.5–9.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 95.5 | 93.1–97.9 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 95.5 | 93.1–97.9 | % |  |
| Optimal adult annual survival rate (from allometric model) | 94.7 | 93.4–95.8 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.8–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 13 700 | 11 100–16 600 | Pairs |  |
| Total population size (from raw input parameters) | 89 100 | 60 100–140 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.061 | 0.055–0.069 | |  |

1.11 Northern Buller's albatross (*Thalassarche bulleri platei*)

Table 21: Raw input data of population parameters of northern Buller's albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------------|---|---------|
| Population (NZ) | 16 346 pairs [2008] | Agreement on the Conservation of Albatrosses and Petrels (2010) | High |
| Age at first reproduction | 12 years [2011] | Southern Buller's albatross as proxy; Francis & Sagar (2012) | |
| Current survival rate | 93.5 (93–98) % [2011] | Southern Buller's albatross as proxy; Francis & Sagar (2012) | |
| Optimal survival rate | 93.5 (93–98) % [2011] | Southern Buller's albatross as proxy; Francis & Sagar (2012) | |
| Body mass | 2 837 g | Myhrvold et al. (2015) | |
| Breeding period | October–June | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 2.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

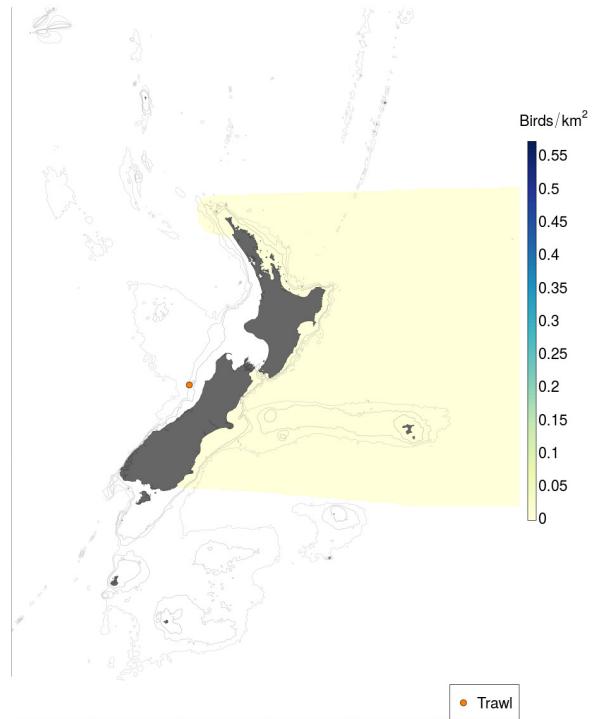

Figure 11: Relative density of northern Buller's albatross (*Thalassarche bulleri platei*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl fisheries.

Table 22: Derived values of population parameters of northern Buller's albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

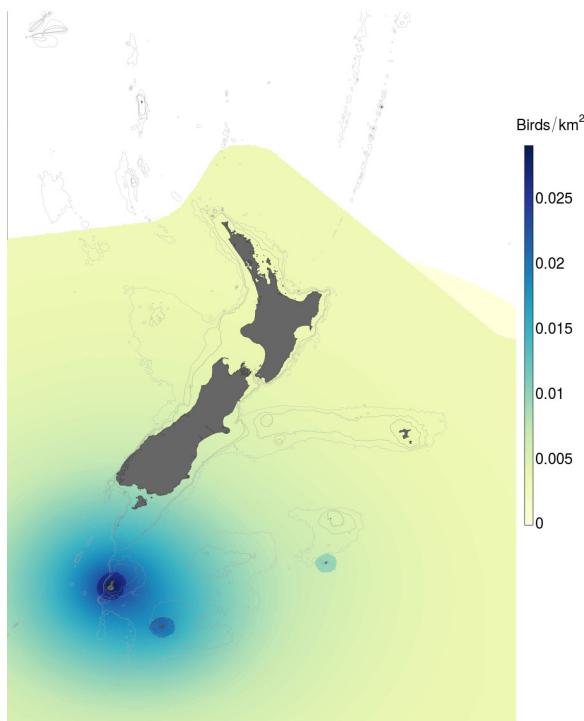

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 12.0 | 9.1–14.8 | Years |  |
| Age at first reproduction (from allometric model) | 8.5 | 7.5–9.7 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 95.5 | 93.1–97.9 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 95.5 | 93.1–97.9 | % |  |
| Optimal adult annual survival rate (from allometric model) | 94.7 | 93.5–95.8 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.8–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 16 400 | 13 300–20 000 | Pairs |  |
| Total population size (from raw input parameters) | 106 000 | 70 500–167 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.061 | 0.054–0.069 | |  |

1.12 Light-mantled sooty albatross (*Phoebetria palpebrata*)

Table 23: Raw input data of population parameters of light-mantled sooty albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|----------------------|--|---------|
| Population (NZ) | 6 770 to 6 900 pairs | Taylor (2000a) | Poor |
| Age at first reproduction | 12 years | de L. Brooke (2004) | Poor |
| Current survival rate | 96 to 98 % [1997] | Gibson’s albatross as proxy; Walker & Elliott (1999) | |
| Optimal survival rate | 96 to 98 % [1997] | Gibson’s albatross as proxy; Walker & Elliott (1999) | |
| Body mass | 2 892 g | Myhrvold et al. (2015) | |
| Breeding period | September–June | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 20% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

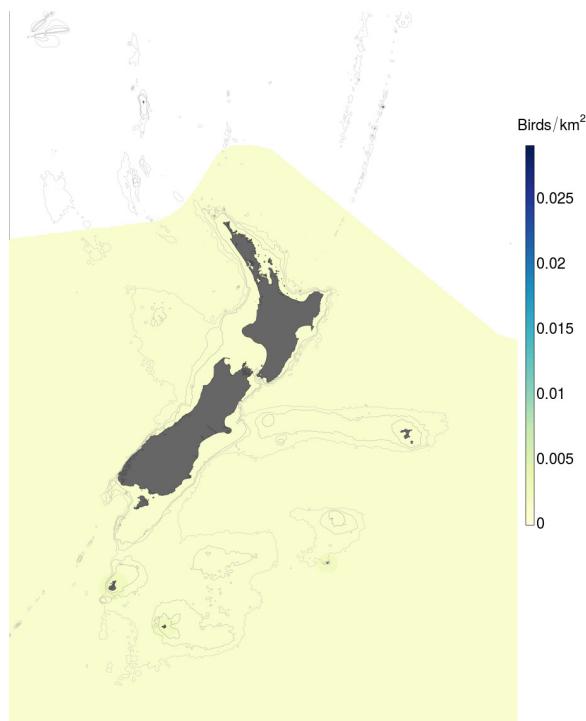

Figure 12: Relative density of light-mantled sooty albatross (*Phoebetria palpebrata*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 24: Derived values of population parameters of light-mantled sooty albatross for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

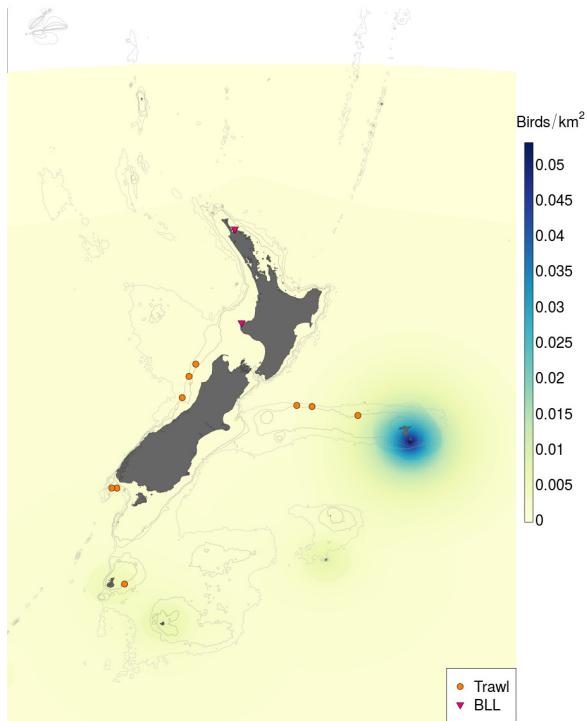

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 12.0 | 9.1–14.9 | Years |  |
| Age at first reproduction (from allometric model) | 8.5 | 7.5–9.7 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 97.0 | 96.1–98.0 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 97.0 | 96.0–97.9 | % |  |
| Optimal adult annual survival rate (from allometric model) | 94.7 | 93.5–95.8 | % |  |
| Proportion of adults breeding (from raw input parameters) | 59.9 | 50.0–69.4 | % |  |

| Breeding period | August–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 75% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

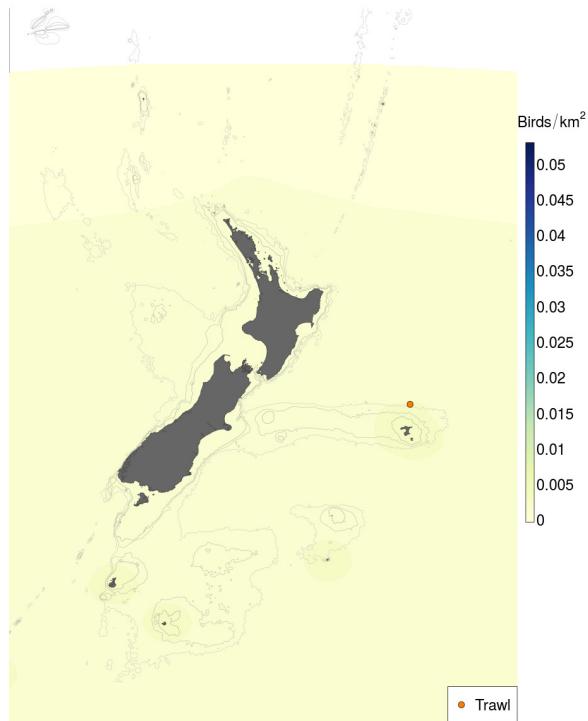

Figure 13: Relative density of northern giant petrel (*Macronectes halli*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl and bottom-longline (BLL) fisheries.

Table 26: Derived values of population parameters of northern giant petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

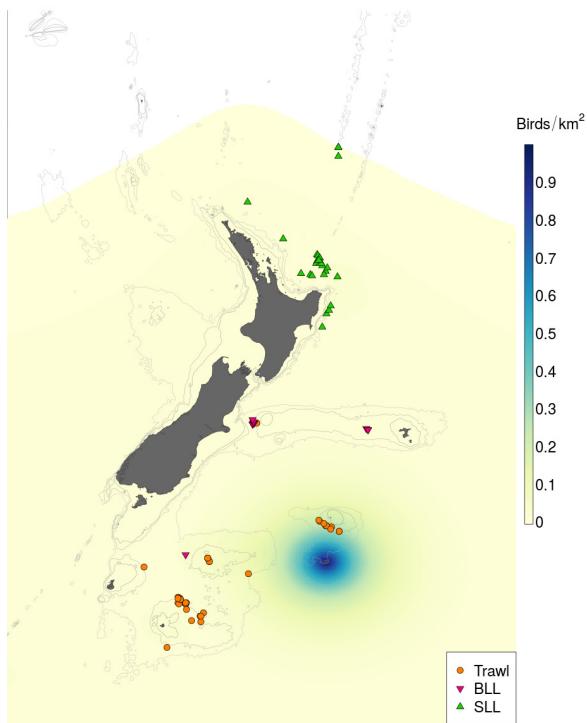

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 8.0 | 6.1–9.9 | Years |  |
| Age at first reproduction (from allometric model) | 9.5 | 8.2–10.9 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 88.7 | 81.2–96.0 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 88.6 | 81.2–96.1 | % |  |
| Optimal adult annual survival rate (from allometric model) | 95.2 | 94.0–96.3 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 74.5–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 2 610 | 2 160–3 110 | Pairs |  |
| Total population size (from raw input parameters) | 24 500 | 11 700–58 400 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.055 | 0.048–0.063 | |  |

1.14 Grey petrel (*Procellaria cinerea*)

Table 27: Raw input data of population parameters of grey petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-------------------------------|---|---------|
| Population (NZ) | 32 000 to 73 000 pairs [2012] | Bell et al. (2013) | |
| Age at first reproduction | 7 years | Barbraud et al. (2009) | |
| Current survival rate | 90 to 97 % | White-chinned petrel as proxy; Dillingham & Fletcher (2008) | |
| Optimal survival rate | 90 to 97 % | White-chinned petrel as proxy; Dillingham & Fletcher (2008) | |
| Body mass | 1 131 g | Myhrvold et al. (2015) | |
| Breeding period | February–November | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 2.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

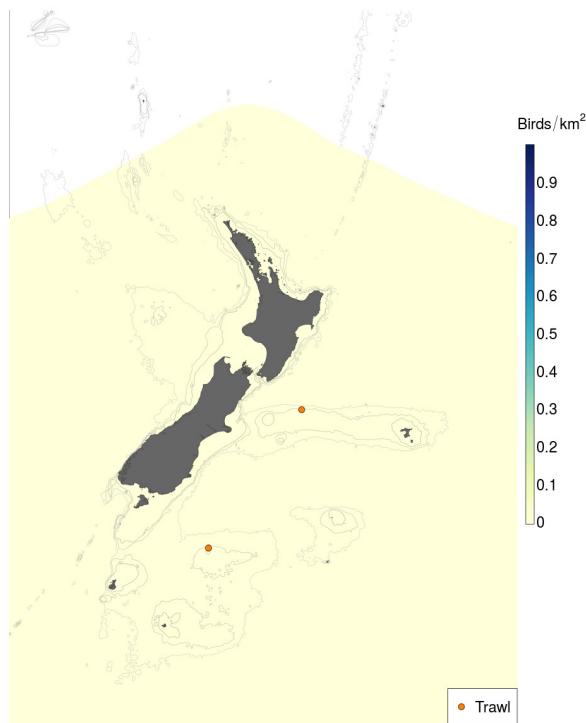

Figure 14: Relative density of grey petrel (*Procellaria cinerea*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), and bottom-longline (BLL) fisheries.

Table 28: Derived values of population parameters of grey petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

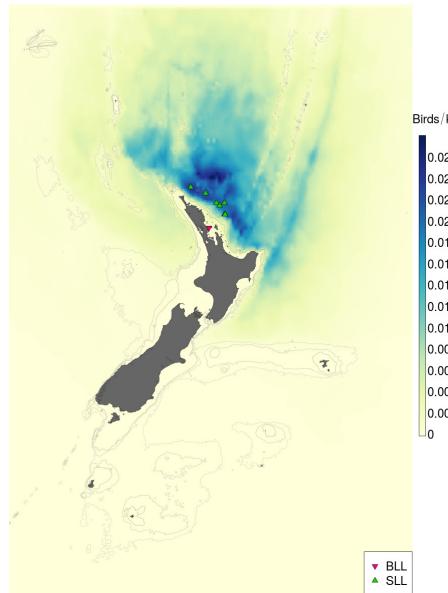

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 7.0 | 5.1–8.9 | Years |  |
| Age at first reproduction (from allometric model) | 6.7 | 6.0–7.5 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.5 | 90.2–96.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.5 | 90.2–96.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 93.2 | 91.6–94.6 | % |  |
| Proportion of adults breeding (from raw input parameters) | 79.4 | 68.6–88.1 | % |  |
| Annual breeding pairs (from raw input parameters) | 49 700 | 32 700–71 400 | Pairs |  |
| Total population size (from raw input parameters) | 278 000 | 163 000–455 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.080 | 0.071–0.089 | |  |

1.15 Black petrel (*Procellaria parkinsoni*)

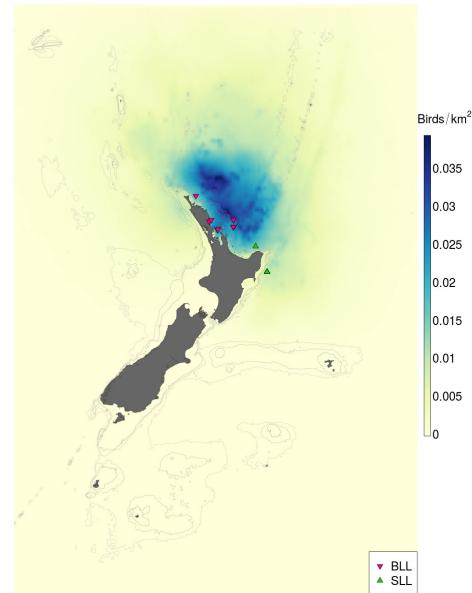

Table 29: Raw input data of population parameters of black petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------------------------|--------------------------|---------|
| Population (NZ) | 4627 (95% c.i.: 1972 – 9777) pairs | Richard & Abraham (2015) | High |
| Age at first reproduction | 6.6 ± 0.2 years [2010] | Bell et al. (2011) | High |
| Current survival rate | $92.7 \pm 1.2\%$ [2016] | Bell et al. (2016) | High |
| Optimal survival rate | 95 % | Walker et al. (2015) | High |
| Body mass | 702 g | Myhrvold et al. (2015) | |
| Breeding period | October–July | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0.5% | G. Taylor (pers. comm.) | |

(a) Pre-egg laying (Oct–Nov)

(b) Incubation (Dec–Jan)

(c) Chick rearing (Feb–May)

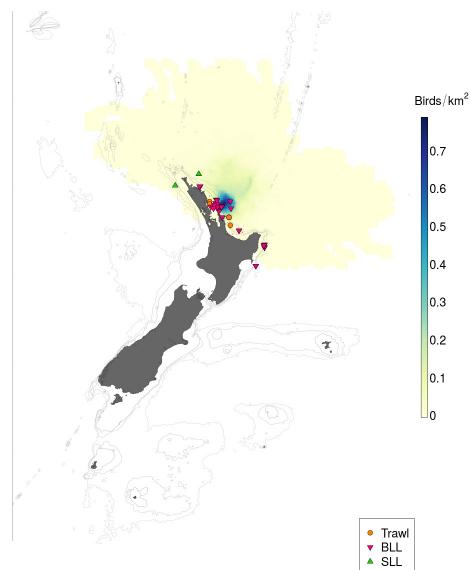

Figure 15: Relative density of black petrel (*Procellaria parkinsoni*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), and bottom-longline (BLL) fisheries.

Table 30: Derived values of population parameters of black petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

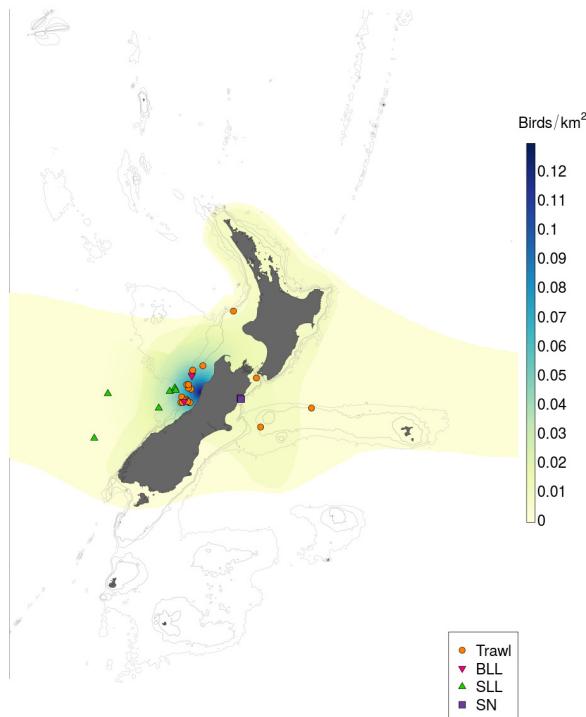

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|--------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.6 | 6.2–7.0 | Years |  |
| Age at first reproduction (from allometric model) | 6.0 | 5.3–6.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 92.7 | 89.9–94.7 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 94.9 | 92.6–96.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 92.3 | 90.3–94.1 | % |  |
| Proportion of adults breeding (from raw input parameters) | 79.5 | 68.6–88.0 | % |  |
| Annual breeding pairs (from raw input parameters) | 4 630 | 1 970–9 780 | Pairs |  |
| Total population size (from raw input parameters) | 19 200 | 9 630–36 700 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.091 | 0.080–0.103 | |  |

1.16 Westland petrel (*Procellaria westlandica*)

Table 31: Raw input data of population parameters of Westland petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------------------|-------------------------|---------|
| Population (NZ) | 2 954 to 5 137 pairs [2013] | Wood & Otley (2013) | High |
| Age at first reproduction | 6.5 years [2002] | Waugh et al. (2006) | |
| Current survival rate | 91.8 to 97.5 % | Waugh et al. (2015) | |
| Optimal survival rate | 91.8 to 97.5 | Waugh et al. (2015) | |
| Body mass | 1 204 g | Myhrvold et al. (2015) | |
| Breeding period | March–December | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 2.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

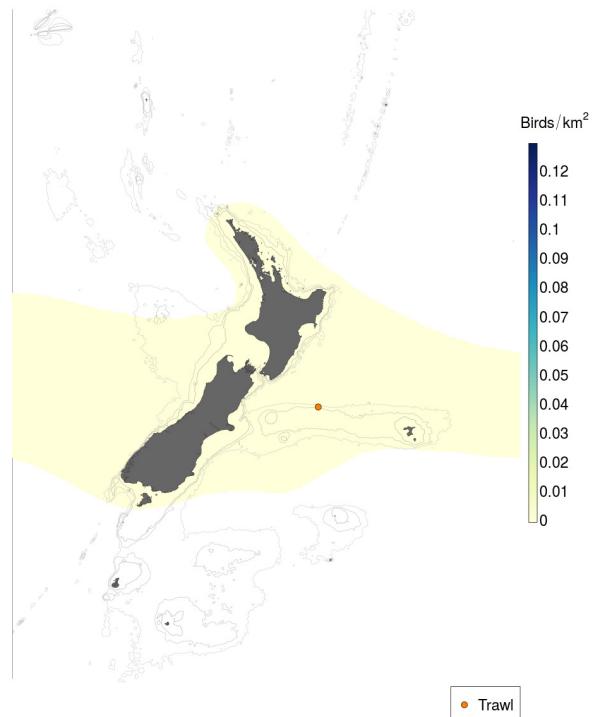

Figure 16: Relative density of Westland petrel (*Procellaria westlandica*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 32: Derived values of population parameters of Westland petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

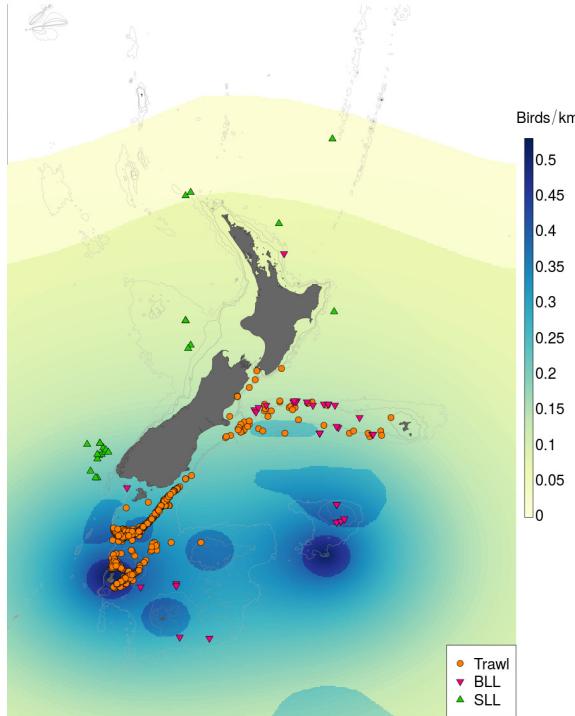

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 4.1–8.9 | Years |  |
| Age at first reproduction (from allometric model) | 6.8 | 6.1–7.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 94.7 | 91.9–97.4 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 94.7 | 91.9–97.4 | % |  |
| Optimal adult annual survival rate (from allometric model) | 93.3 | 91.8–94.7 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 74.8–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 3 940 | 3 000–5 060 | Pairs |  |
| Total population size (from raw input parameters) | 17 900 | 12 200–26 300 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.078 | 0.070–0.087 | |  |

1.17 White-chinned petrel (*Procellaria aequinoctialis*)

Table 33: Raw input data of population parameters of white-chinned petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------------|---|---------|
| Population (NZ) | 204 725 to 368 125 pairs | Rexer-Huber et al. (2016), Sommer et al. (2010), Sommer et al. (2011) | High |
| Age at first reproduction | 6.5 years | Schreiber & Burger (2001) | |
| Current survival rate | 90 to 97 % | Dillingham & Fletcher (2008) | |
| Optimal survival rate | 90 to 97 % | Dillingham & Fletcher (2008) | |
| Body mass | 1 318 g | Myhrvold et al. (2015) | |
| Breeding period | November–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 20% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

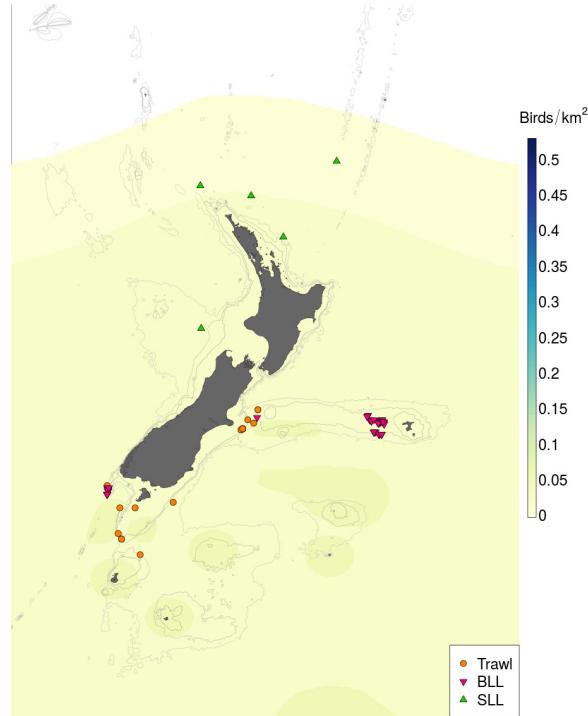

Figure 17: Relative density of white-chinned petrel (*Procellaria aequinoctialis*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), and bottom-longline (BLL) fisheries.

Table 34: Derived values of population parameters of white-chinned petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

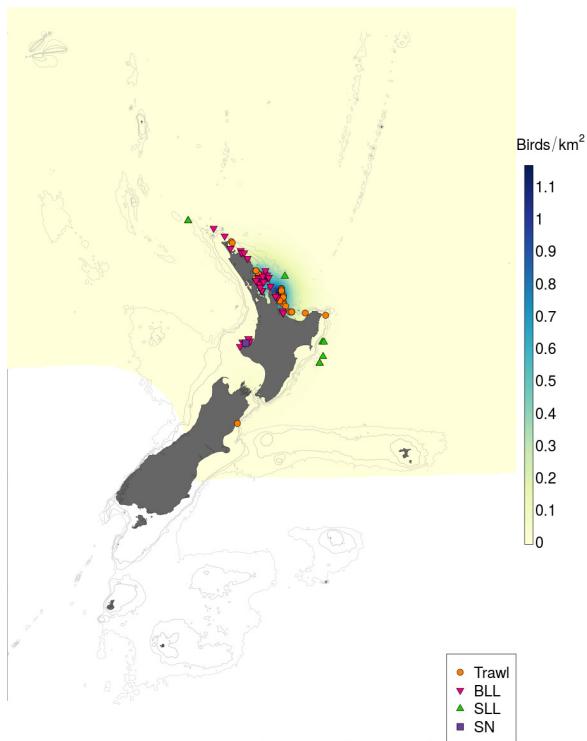

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|-------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 4.1–8.9 | Years |  |
| Age at first reproduction (from allometric model) | 7.0 | 6.3–7.8 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.5 | 90.2–96.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.5 | 90.2–96.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 93.5 | 92.0–94.9 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.1 | 75.8–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 279 000 | 208 000–362 000 | Pairs |  |
| Total population size (from raw input parameters) | 1 340 000 | 865 000–2 130 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.076 | 0.068–0.085 | |  |

1.18 Flesh-footed shearwater (*Puffinus carneipes*)

Table 35: Raw input data of population parameters of flesh-footed shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-------------------------------|-------------------------|---------|
| Population (NZ) | 10 000 to 15 000 pairs [2013] | Waugh et al. (2013) | |
| Age at first reproduction | 4 to 9 years [1973] | Bradley et al. (1999) | |
| Current survival rate | 93.1 to 94 % [2014] | Barbraud et al. (2014) | High |
| Optimal survival rate | 94 % | Walker et al. (2015) | |
| Body mass | 614 g | Myhrvold et al. (2015) | |
| Breeding period | September–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

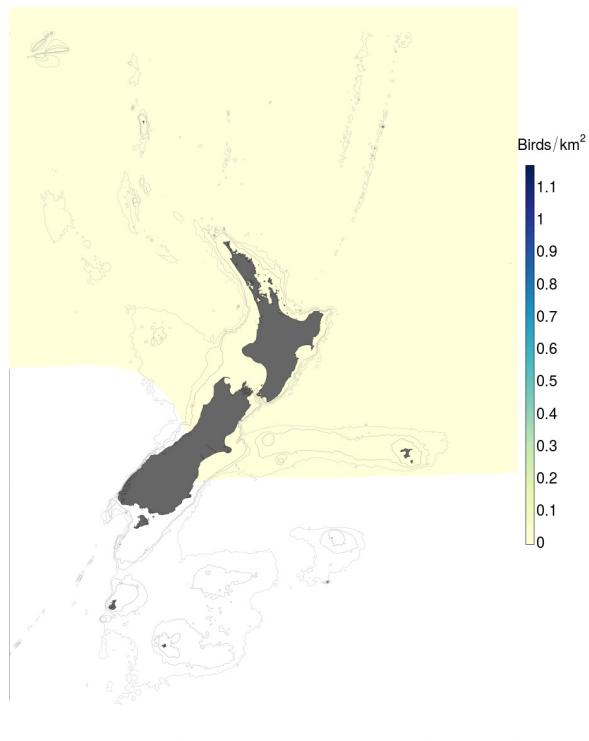

Figure 18: Relative density of flesh-footed shearwater (*Puffinus carneipes*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 36: Derived values of population parameters of flesh-footed shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

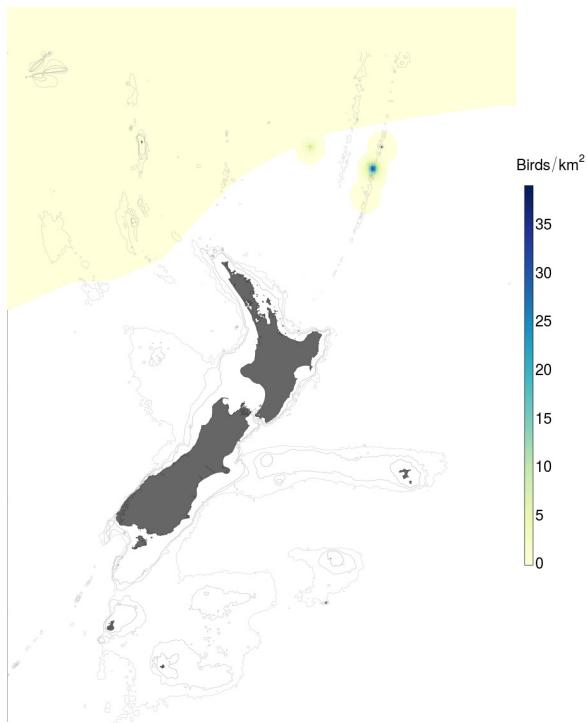

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 4.2–8.9 | Years |  |
| Age at first reproduction (from allometric model) | 5.8 | 5.2–6.4 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.5 | 93.1–94.0 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.2 | 84.4–97.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 92.1 | 89.9–94.0 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 74.9–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 12 300 | 10 100–14 900 | Pairs |  |
| Total population size (from raw input parameters) | 61 500 | 44 900–82 700 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.094 | 0.083–0.107 | |  |

1.19 Wedge-tailed shearwater (*Puffinus pacificus*)

Table 37: Raw input data of population parameters of wedge-tailed shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------------|---|---------|
| Population (NZ) | 50 000 pairs | Waugh et al. (2013) | Poor |
| Age at first reproduction | 4 years | Schreiber & Burger (2001) | |
| Current survival rate | 93.1 (88.9–95.8) % [1999] | Hutton’s shearwater as proxy; Cuthbert & Davis (2002) | |
| Optimal survival rate | 93.1 (88.9–95.8) % [1999] | Hutton’s shearwater as proxy; Cuthbert & Davis (2002) | |
| Body mass | 429 g | Myhrvold et al. (2015) | |
| Breeding period | October–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

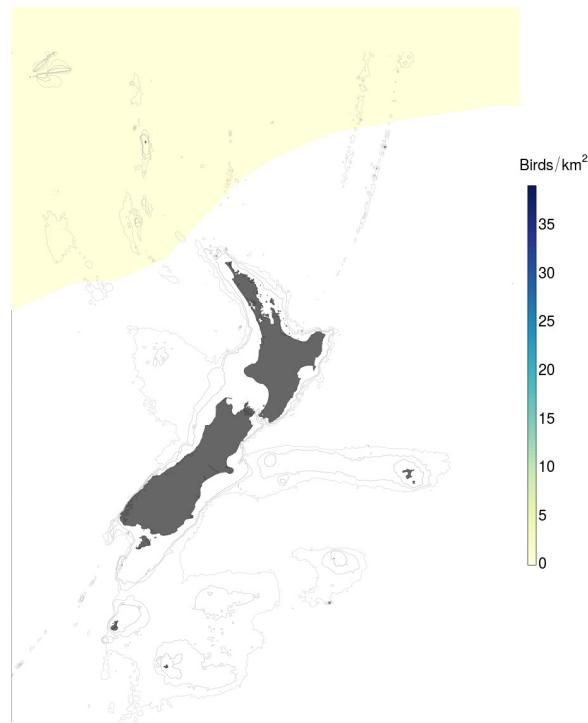

Figure 19: Relative density of wedge-tailed shearwater (*Puffinus pacificus*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 38: Derived values of population parameters of wedge-tailed shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

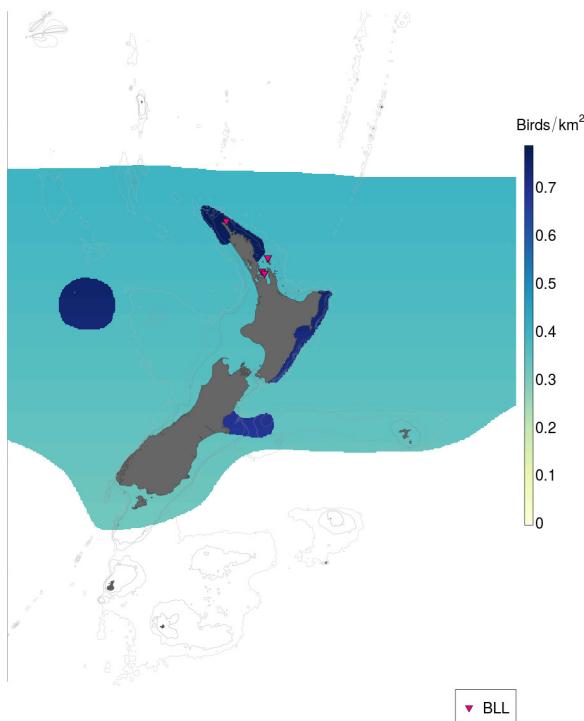

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.1–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 5.3 | 4.6–6.0 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 92.4 | 89.1–95.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 92.3 | 89.1–95.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 91.3 | 88.3–93.6 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 76.0–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 52 100 | 28 200–92 000 | Pairs |  |
| Total population size (from raw input parameters) | 226 000 | 120 000–391 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.105 | 0.090–0.121 | |  |

1.20 Buller's shearwater (*Puffinus bulleri*)

Table 39: Raw input data of population parameters of Buller's shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------------|---|---------|
| Population (NZ) | 300 000 to 400 000 pairs | Waugh et al. (2013) | Poor |
| Age at first reproduction | 4 to 9 years [1973] | Bradley et al. (1999) | |
| Current survival rate | 92 % | Short-tailed shearwater as proxy; de L. Brooke (2004) | |
| Optimal survival rate | 92 % | Short-tailed shearwater as proxy; de L. Brooke (2004) | |
| Body mass | 355 g | Myhrvold et al. (2015) | |
| Breeding period | September–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

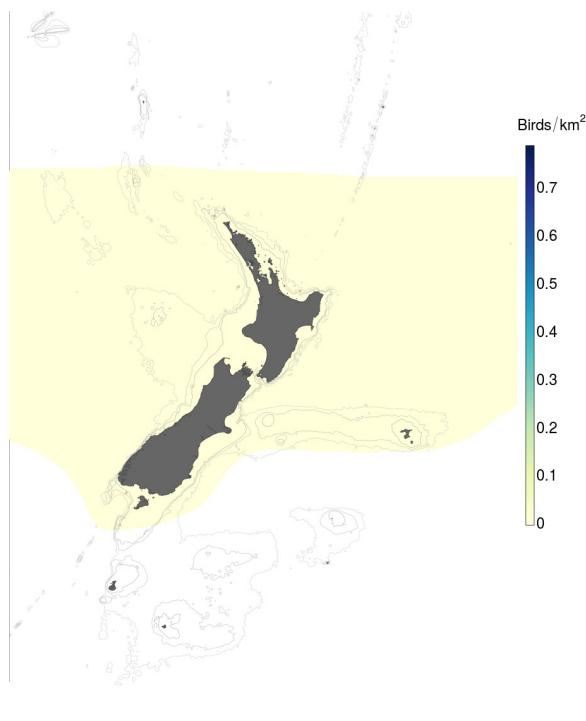

Figure 20: Relative density of Buller's shearwater (*Puffinus bulleri*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in bottom-longline (BLL) fisheries.

Table 40: Derived values of population parameters of Buller's shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

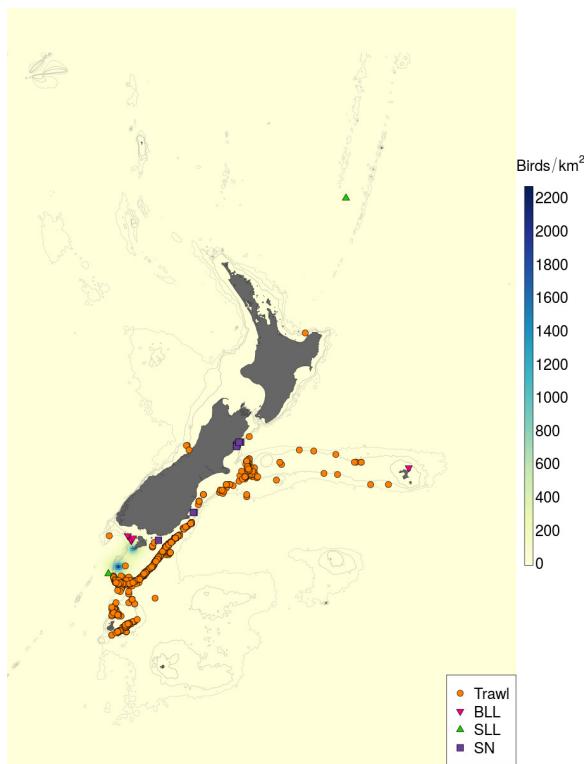

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|---------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 4.1–8.9 | Years |  |
| Age at first reproduction (from allometric model) | 5.0 | 4.4–5.7 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 91.5 | 84.1–96.3 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 91.5 | 83.6–96.3 | % |  |
| Optimal adult annual survival rate (from allometric model) | 90.8 | 87.5–93.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.0–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 347 000 | 302 000–397 000 | Pairs |  |
| Total population size (from raw input parameters) | 2 020 000 | 1 280 000–3 630 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.111 | 0.095–0.130 | |  |

1.21 Sooty shearwater (*Puffinus griseus*)

Table 41: Raw input data of population parameters of sooty shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------|-------------------------|---------|
| Population (NZ) | 5 000 000 pairs | Waugh et al. (2013) | Poor |
| Age at first reproduction | 5 to 7 years | de L. Brooke (2004) | |
| Current survival rate | 86 to 97.9 % [2005] | Clucas et al. (2008) | |
| Optimal survival rate | 86 to 97.9 % [2005] | Clucas et al. (2008) | |
| Body mass | 787 g | Myhrvold et al. (2015) | |
| Breeding period | November–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

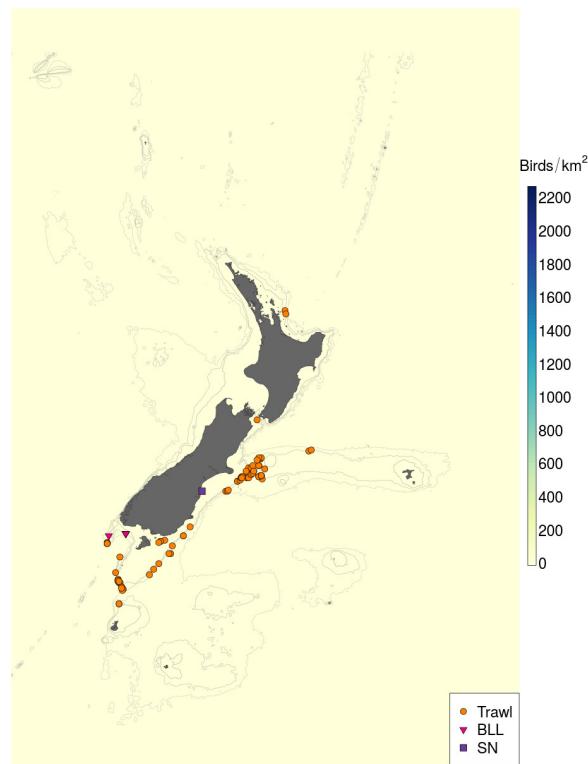

Figure 21: Relative density of sooty shearwater (*Puffinus griseus*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 42: Derived values of population parameters of sooty shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|------------|-----------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.0 | 5.1–6.9 | Years |  |
| Age at first reproduction (from allometric model) | 6.1 | 5.5–6.8 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 91.8 | 86.3–97.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 92.0 | 86.3–97.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 92.5 | 90.6–94.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.5–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 5 230 000 | 2 740 000–9 070 000 | Pairs |  |
| Total population size (from raw input parameters) | 27 900 000 | 13 300 000–55 500 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.088 | 0.078–0.100 | |  |

1.22 Fluttering shearwater (*Puffinus gavia*)

Table 43: Raw input data of population parameters of fluttering shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------------|---|---------|
| Population (NZ) | 100 000 to 500 000 pairs | Waugh et al. (2013) | Poor |
| Age at first reproduction | 4 to 6 years | Hutton’s shearwater as proxy; Waugh et al. (1999) | |
| Current survival rate | 93.1 (88.9–95.8) % [1999] | Hutton’s shearwater as proxy; Cuthbert & Davis (2002) | |
| Optimal survival rate | 93.1 (88.9–95.8) % [1999] | Hutton’s shearwater as proxy; Cuthbert & Davis (2002) | |
| Body mass | 232 g | Myhrvold et al. (2015) | |
| Breeding period | July–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 80% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

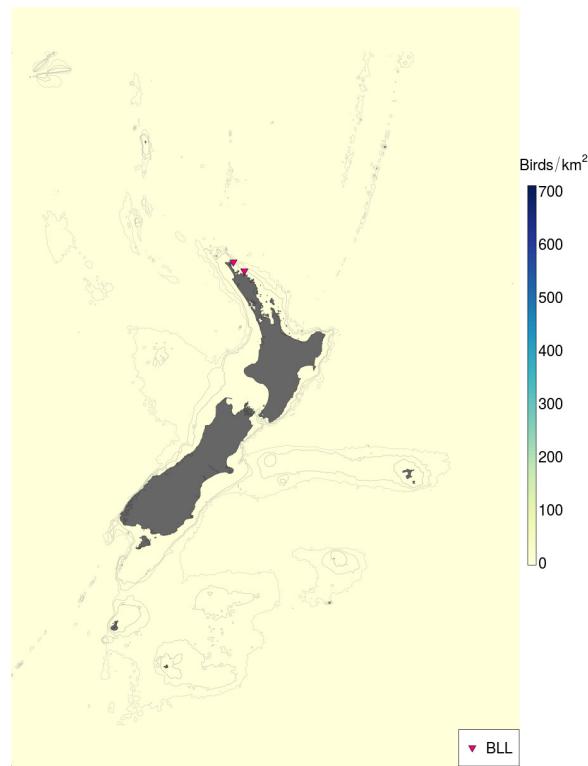

Figure 22: Relative density of fluttering shearwater (*Puffinus gavia*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in bottom-longline (BLL) and set-net (SN) fisheries.

Table 44: Derived values of population parameters of fluttering shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

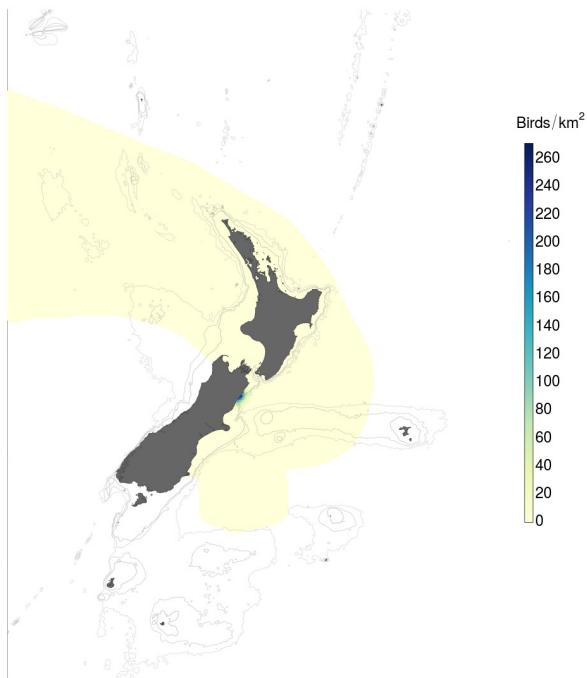

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|-------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 5.0 | 4.1–6.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.5 | 3.8–5.3 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 92.3 | 89.1–95.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 92.4 | 89.1–95.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 89.7 | 85.1–93.0 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.8–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 250 000 | 104 000–483 000 | Pairs |  |
| Total population size (from raw input parameters) | 1 150 000 | 496 000–2 260 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.126 | 0.104–0.152 | |  |

1.23 Hutton's shearwater (*Puffinus huttoni*)

Table 45: Raw input data of population parameters of Hutton's shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------------|-------------------------|---------|
| Population () | 114 000 pairs | Waugh et al. (2013) | Medium |
| Age at first reproduction | 4 to 6 years | Waugh et al. (1999) | |
| Current survival rate | 93.1 (88.9–95.8) % [1999] | Cuthbert & Davis (2002) | High |
| Optimal survival rate | 93.1 (88.9–95.8) % [1999] | Cuthbert & Davis (2002) | High |
| Body mass | 364 g | Myhrvold et al. (2015) | |
| Breeding period | September–April | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 2.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

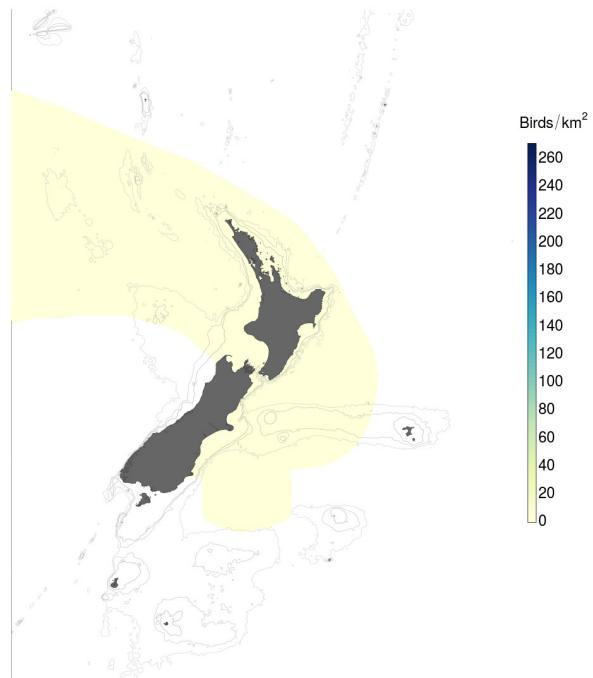

Figure 23: Relative density of Hutton's shearwater (*Puffinus huttoni*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 46: Derived values of population parameters of Hutton's shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

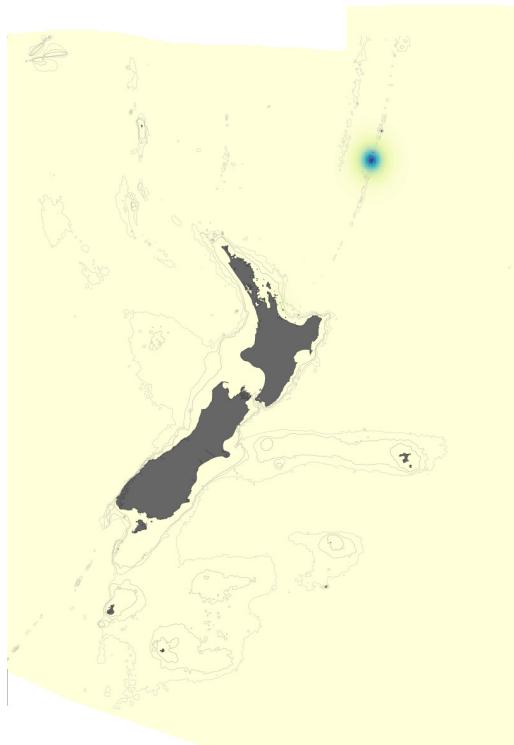

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 5.0 | 4.1–6.0 | Years |  |
| Age at first reproduction (from allometric model) | 5.1 | 4.4–5.8 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 92.3 | 89.1–95.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 92.3 | 89.1–95.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 90.9 | 87.7–93.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.5–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 116 000 | 77 300–167 000 | Pairs |  |
| Total population size (from raw input parameters) | 547 000 | 344 000–824 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.110 | 0.094–0.128 | |  |

1.24 Little shearwater (*Puffinus assimilis*)

Table 47: Raw input data of population parameters of little shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------------|---|---------|
| Population (NZ) | 115 000 to 210 000 pairs | Waugh et al. (2013) | |
| Age at first reproduction | 4 to 6 years | Hutton’s shearwater as proxy; Waugh et al. (1999) | |
| Current survival rate | 93.1 (88.9–95.8) % [1999] | Hutton’s shearwater as proxy; Cuthbert & Davis (2002) | |
| Optimal survival rate | 93.1 (88.9–95.8) % [1999] | Hutton’s shearwater as proxy; Cuthbert & Davis (2002) | |
| Body mass | 225 g | Myhrvold et al. (2015) | |
| Breeding period | April–November | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

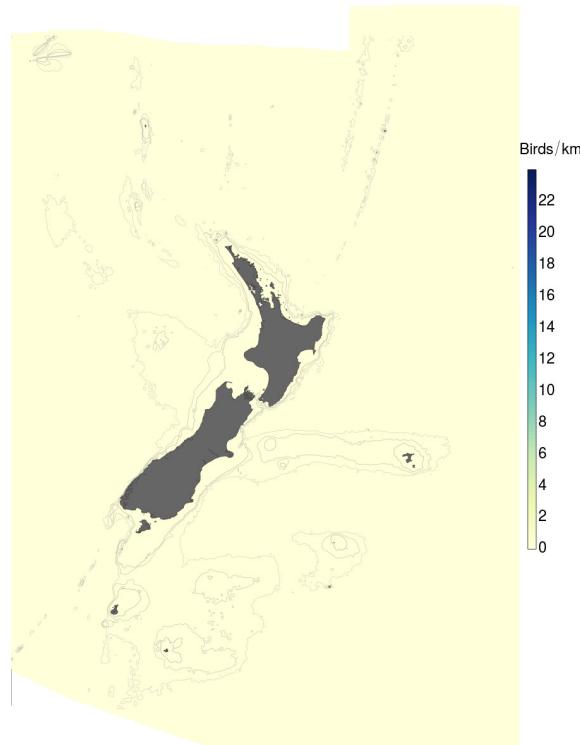

Figure 24: Relative density of little shearwater (*Puffinus assimilis*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 48: Derived values of population parameters of little shearwater for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

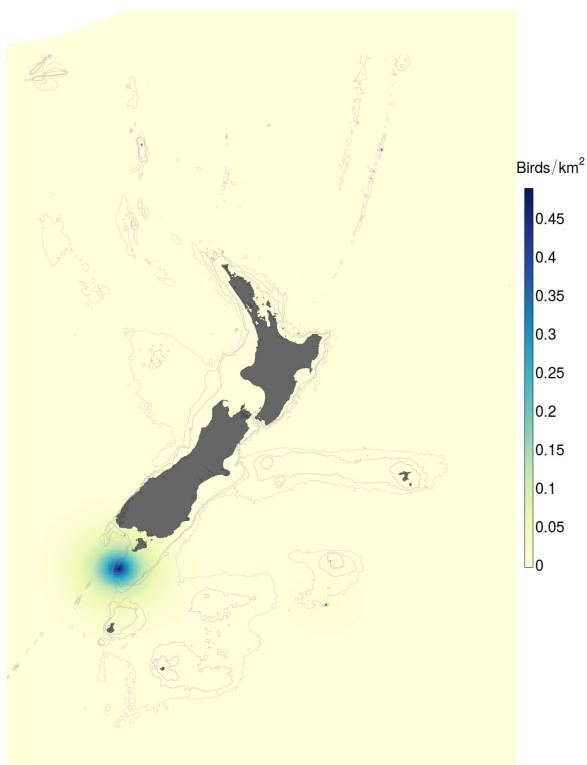

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 5.0 | 4.0–5.9 | Years |  |
| Age at first reproduction (from allometric model) | 4.5 | 3.8–5.3 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 92.3 | 89.1–95.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 92.3 | 89.1–95.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 89.6 | 85.4–92.9 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.8–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 158 000 | 117 000–207 000 | Pairs |  |
| Total population size (from raw input parameters) | 688 000 | 466 000–1 010 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.127 | 0.104–0.152 | |  |

1.25 Snares Cape petrel (*Daption capense australis*)

Table 49: Raw input data of population parameters of Snares Cape petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------------|---------------------------|---------|
| Population (NZ) | 8 420 pairs | de L. Brooke (2004) | |
| Age at first reproduction | 3 to 5 years [1968] | Beck (1969) | Medium |
| | 6 years | Schreiber & Burger (2001) | |
| Current survival rate | 77.1 to 93.9 % [1987] | Sagar et al. (1996) | Poor |
| Optimal survival rate | 77.1 to 93.9 % [1987] | Sagar et al. (1996) | Poor |
| Body mass | 431 g | Myhrvold et al. (2015) | |
| Breeding period | November–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 90% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

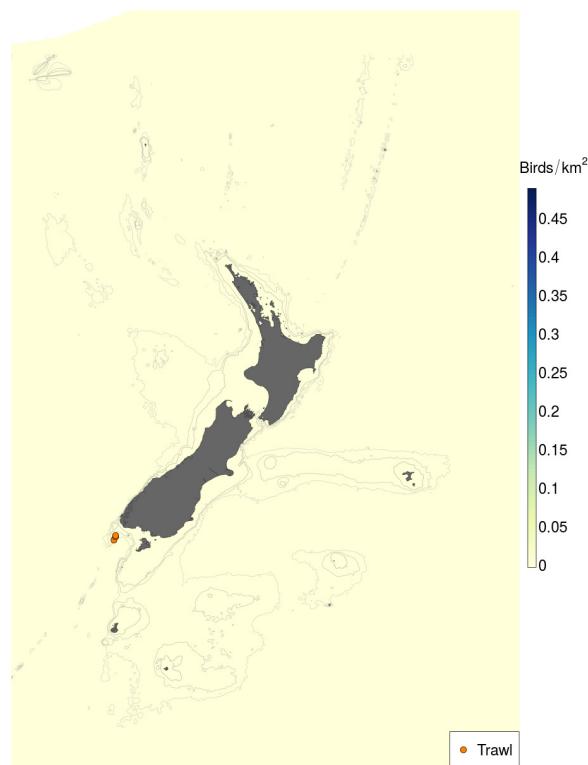

Figure 25: Relative density of Snares Cape petrel (*Daption capense australis*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl fisheries.

Table 50: Derived values of population parameters of Snares Cape petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

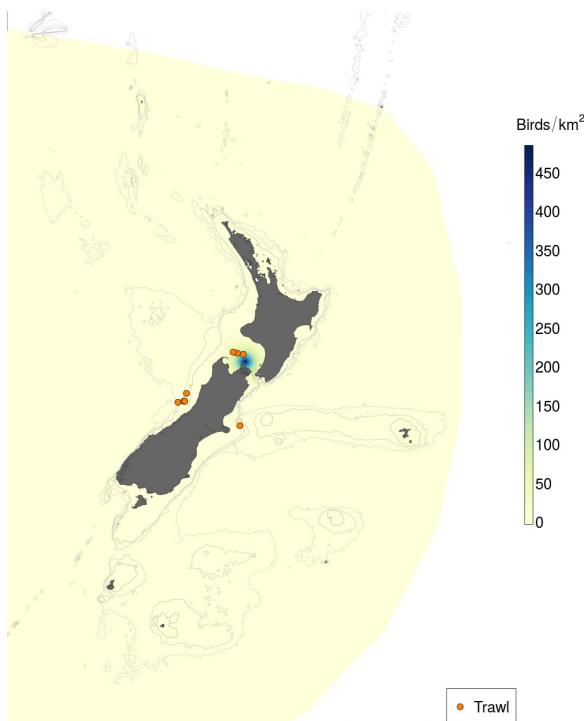

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 5.5 | 3.2–7.9 | Years |  |
| Age at first reproduction (from allometric model) | 5.3 | 4.7–6.0 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 85.5 | 77.6–93.5 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 85.5 | 77.6–93.4 | % |  |
| Optimal adult annual survival rate (from allometric model) | 91.2 | 88.3–93.6 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 75.4–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 8 850 | 4 850–15 300 | Pairs |  |
| Total population size (from raw input parameters) | 61 000 | 23 100–151 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.105 | 0.090–0.121 | |  |

1.26 Fairy prion (*Pachyptila turtur*)

Table 51: Raw input data of population parameters of fairy prion for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------|---------------------------|---------|
| Population (NZ) | 1 500 000 pairs | Jamieson et al. (2016) | High |
| Age at first reproduction | 4 to 5 years | Schreiber & Burger (2001) | |
| Current survival rate | 84 % | de L. Brooke (2004) | |
| Optimal survival rate | 84 % | de L. Brooke (2004) | |
| Body mass | 139 g | Myhrvold et al. (2015) | |
| Breeding period | March–January | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 15% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

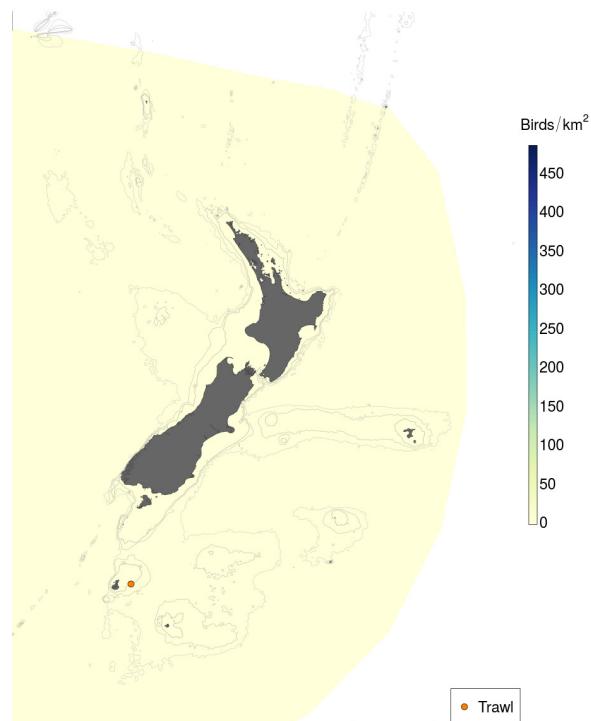

Figure 26: Relative density of fairy prion (*Pachyptila turtur*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl fisheries.

Table 52: Derived values of population parameters of fairy prion for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

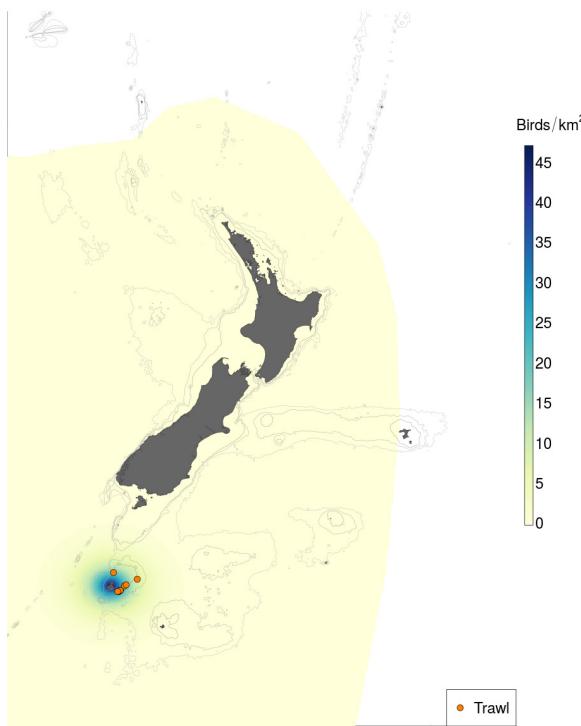

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|----------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.5 | 4.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.0 | 3.3–4.8 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 83.7 | 77.1–88.9 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 83.9 | 77.6–89.2 | % |  |
| Optimal adult annual survival rate (from allometric model) | 88.1 | 82.5–92.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.9–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 1 510 000 | 1 240 000–1 830 000 | Pairs |  |
| Total population size (from raw input parameters) | 8 940 000 | 6 260 000–13 000 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.147 | 0.117–0.183 | |  |

1.27 Antarctic prion (*Pachyptila desolata*)

Table 53: Raw input data of population parameters of Antarctic prion for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|----------------------------|---|---------|
| Population (NZ) | 350 000 to 1 000 000 pairs | Jamieson et al. (2016) | High |
| Age at first reproduction | 5 to 6 years | de L. Brooke (2004) | |
| Current survival rate | 84 % | Fairy prion as proxy; de L. Brooke (2004) | |
| Optimal survival rate | 84 % | Fairy prion as proxy; de L. Brooke (2004) | |
| Body mass | 154 g | Myhrvold et al. (2015) | |
| Breeding period | November–March | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 15% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

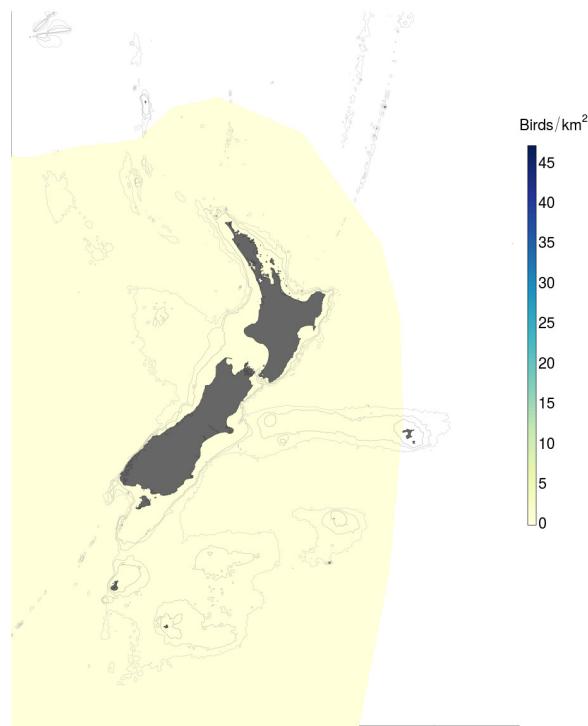

Figure 27: Relative density of Antarctic prion (*Pachyptila desolata*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl fisheries.

Table 54: Derived values of population parameters of Antarctic prion for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

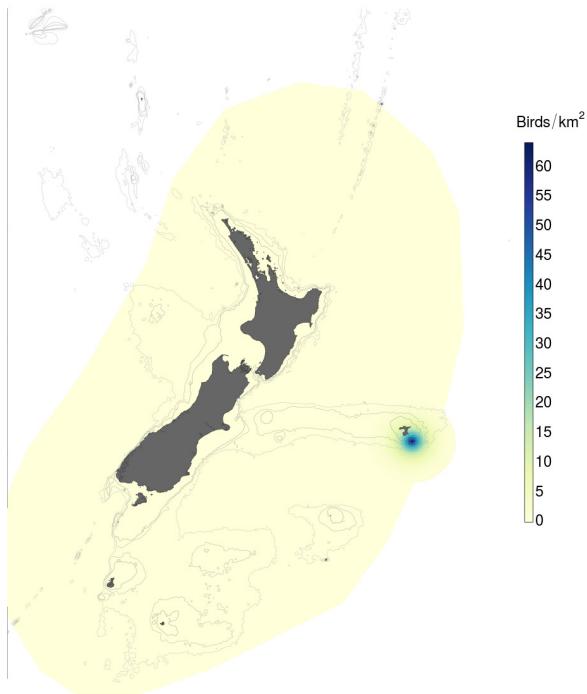

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|---------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 5.5 | 5.0–6.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.1 | 3.4–4.9 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 83.7 | 76.9–89.1 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 83.8 | 77.1–89.2 | % |  |
| Optimal adult annual survival rate (from allometric model) | 88.4 | 82.8–92.6 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 74.9–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 618 000 | 358 000–972 000 | Pairs |  |
| Total population size (from raw input parameters) | 4 320 000 | 2 270 000–7 810 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.142 | 0.115–0.175 | |  |

1.28 Broad-billed prion (*Pachyptila vittata*)

Table 55: Raw input data of population parameters of broad-billed prion for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------|---|---------|
| Population (NZ) | 350 000 pairs | Jamieson et al. (2016) | High |
| Age at first reproduction | 4 to 5 years | Fairy prion as proxy; Schreiber & Burger (2001) | |
| Current survival rate | 84 % | Fairy prion as proxy; de L. Brooke (2004) | |
| Optimal survival rate | 84 % | Fairy prion as proxy; de L. Brooke (2004) | |
| Body mass | 193 g | Myhrvold et al. (2015) | |
| Breeding period | February–January | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

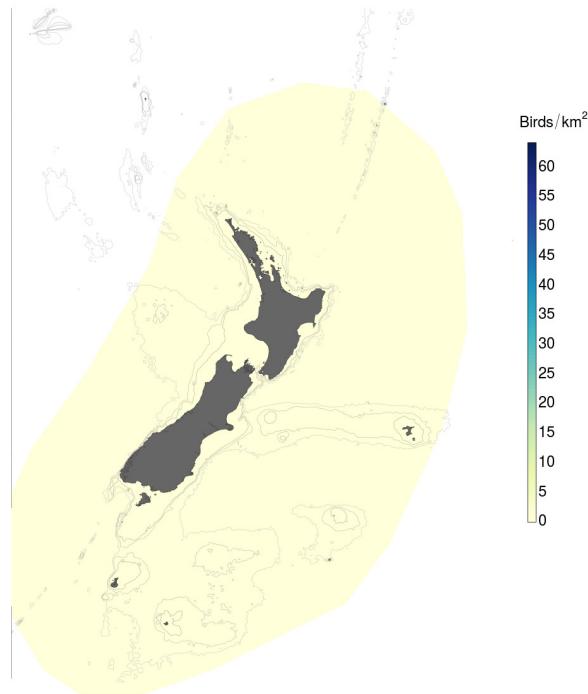

Figure 28: Relative density of broad-billed prion (*Pachyptila vittata*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 56: Derived values of population parameters of broad-billed prion for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

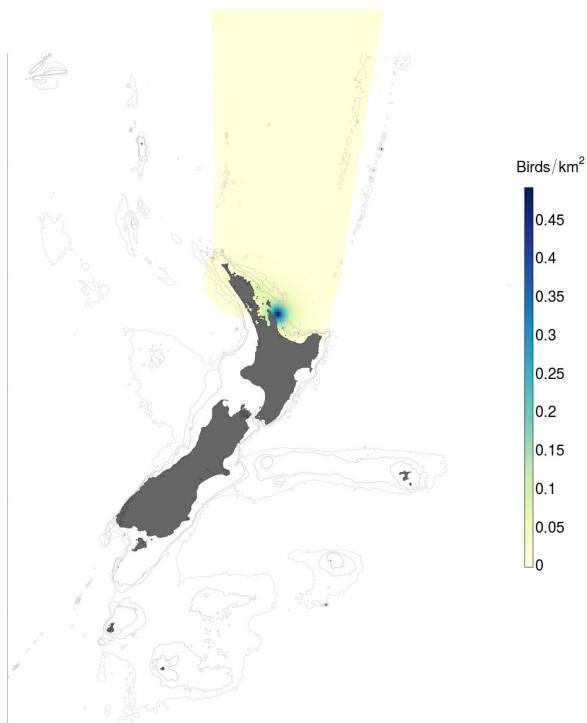

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|---------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.5 | 4.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.3 | 3.6–5.1 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 83.8 | 77.3–89.1 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 83.7 | 77.3–89.0 | % |  |
| Optimal adult annual survival rate (from allometric model) | 89.1 | 84.4–92.8 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.4–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 352 000 | 285 000–429 000 | Pairs |  |
| Total population size (from raw input parameters) | 2 080 000 | 1 430 000–3 010 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.133 | 0.109–0.162 | |  |

1.29 Pycroft's petrel (*Pterodroma pycrofti*)

Table 57: Raw input data of population parameters of Pycroft's petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------------------|---|---------|
| Population (NZ) | 2 000 to 3 000 pairs [1998] | Taylor (2000a) | High |
| Age at first reproduction | 6 to 7 years | Grey-faced petrel as proxy; Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Body mass | 159 g | Myhrvold et al. (2015) | |
| Breeding period | October–April | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

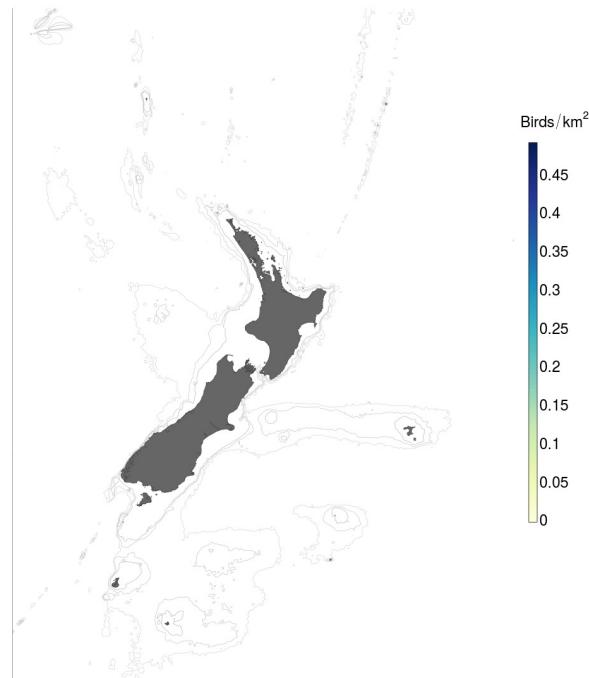

Figure 29: Relative density of Pycroft's petrel (*Pterodroma pycrofti*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 58: Derived values of population parameters of Pycroft's petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

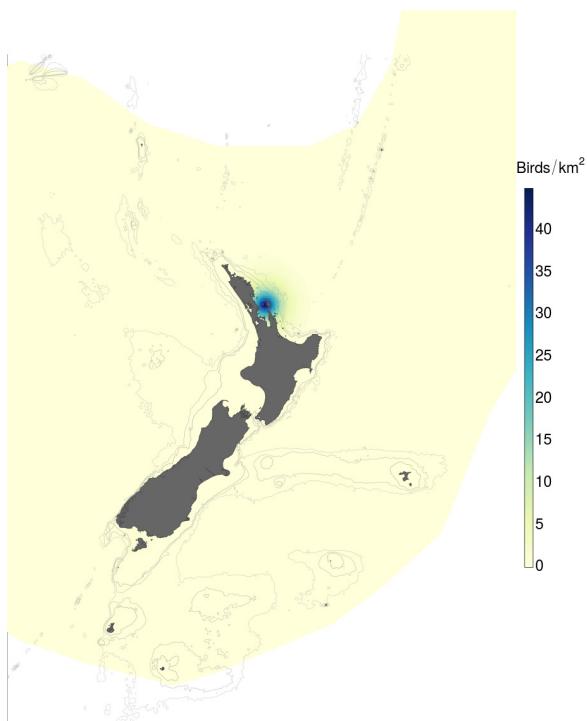

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|--------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 6.0–7.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.1 | 3.4–4.9 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.3 | 84.6–97.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.2 | 85.0–97.7 | % |  |
| Optimal adult annual survival rate (from allometric model) | 88.5 | 83.2–92.6 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.9–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 2 460 | 2 020–2 970 | Pairs |  |
| Total population size (from raw input parameters) | 11 700 | 7 480–19 900 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.141 | 0.113–0.173 | |  |

1.30 Cook's petrel (*Pterodroma cookii*)

Table 59: Raw input data of population parameters of Cook's petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------------|---|---------|
| Population (NZ) | 216 000 to 419 000 pairs | Rayner et al. (2007), Rayner et al. (2008) | High |
| Age at first reproduction | 6 to 7 years | Grey-faced petrel as proxy; Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Body mass | 187 g | Myhrvold et al. (2015) | |
| Breeding period | September–April | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

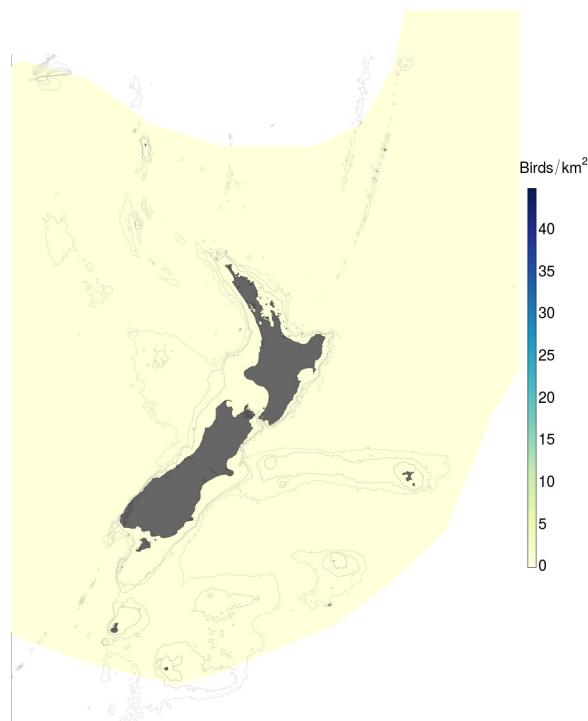

Figure 30: Relative density of Cook's petrel (*Pterodroma cookii*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 60: Derived values of population parameters of Cook's petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

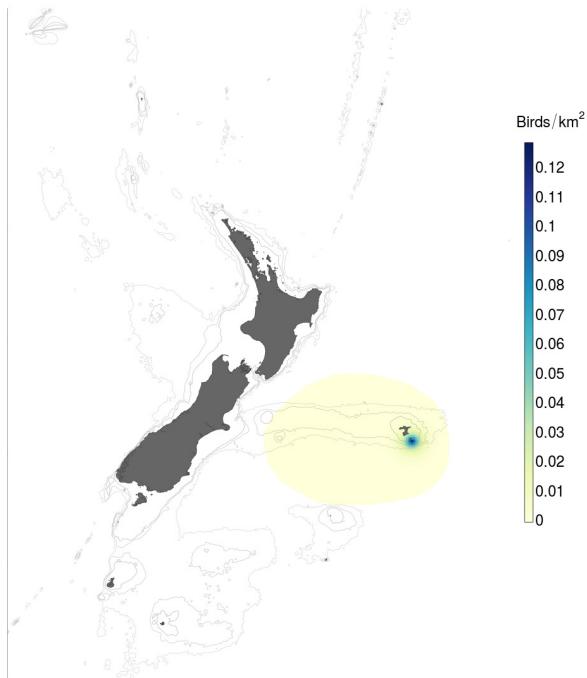

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|-------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 6.0–7.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.3 | 3.6–5.0 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.2 | 84.3–97.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.2 | 84.4–97.7 | % |  |
| Optimal adult annual survival rate (from allometric model) | 89.0 | 84.1–92.7 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.7–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 307 000 | 220 000–412 000 | Pairs |  |
| Total population size (from raw input parameters) | 1 470 000 | 859 000–2 610 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.135 | 0.110–0.163 | |  |

1.31 Chatham petrel (*Pterodroma axillaris*)

Table 61: Raw input data of population parameters of Chatham petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------|---|---------|
| Population (NZ) | 250 pairs [2009] | BirdLife International (2012) | Medium |
| Age at first reproduction | 6 to 7 years | Grey-faced petrel as proxy; Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Body mass | 165 g | Myhrvold et al. (2015) | |
| Breeding period | November–June | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

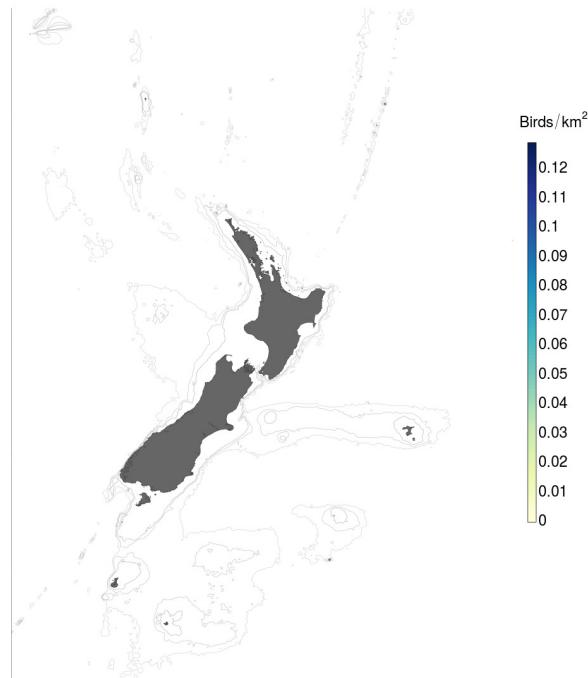

Figure 31: Relative density of Chatham petrel (*Pterodroma axillaris*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 62: Derived values of population parameters of Chatham petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

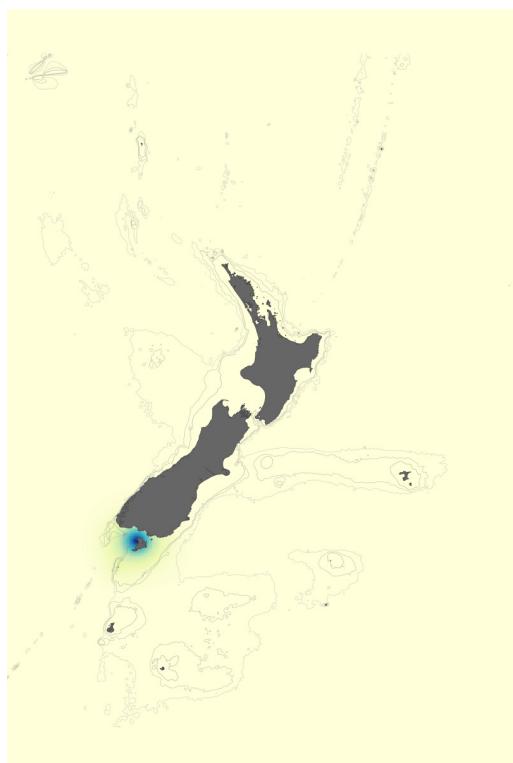

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 6.0–7.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.1 | 3.5–4.9 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.3 | 84.9–97.9 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.2 | 84.5–97.7 | % |  |
| Optimal adult annual survival rate (from allometric model) | 88.6 | 83.8–92.5 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.7–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 255 | 170–367 | Pairs |  |
| Total population size (from raw input parameters) | 1 190 | 674–2 120 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.140 | 0.113–0.171 | |  |

1.32 Mottled petrel (*Pterodroma inexpectata*)

Table 63: Raw input data of population parameters of mottled petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------------------|---|---------|
| Population (NZ) | 300 000 to 400 000 pairs [1999] | Taylor (2000b) | |
| Age at first reproduction | 6 to 7 years | Grey-faced petrel as proxy; Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Body mass | 304 g | Myhrvold et al. (2015) | |
| Breeding period | October–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

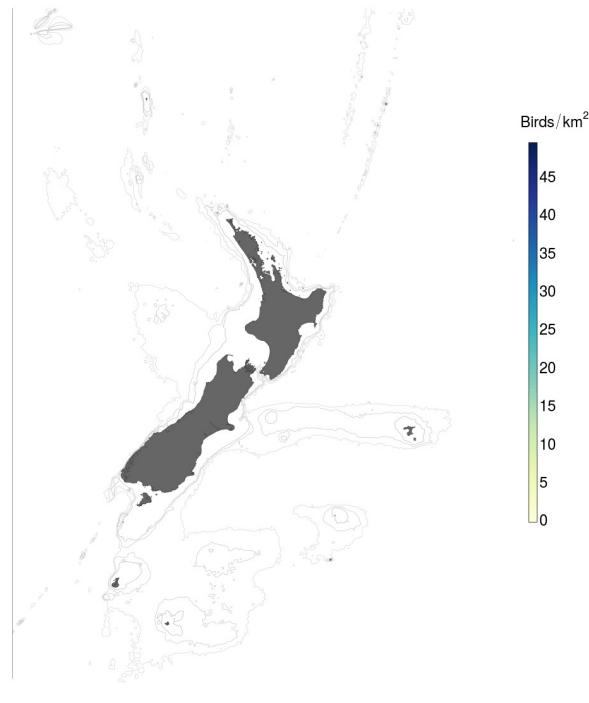

Figure 32: Relative density of mottled petrel (*Pterodroma inexpectata*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 64: Derived values of population parameters of mottled petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

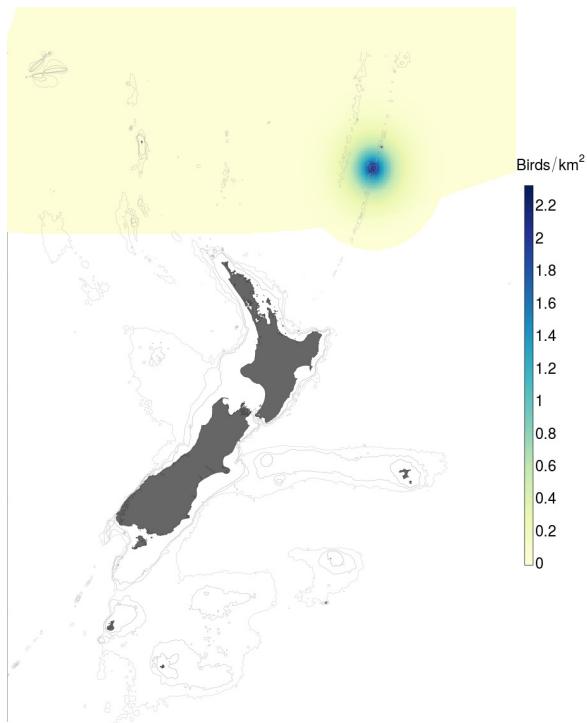

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|---------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 6.0–7.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.8 | 4.2–5.5 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.3 | 84.8–97.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.4 | 85.0–97.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 90.4 | 86.7–93.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.8–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 348 000 | 303 000–397 000 | Pairs |  |
| Total population size (from raw input parameters) | 1 640 000 | 1 100 000–2 620 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.116 | 0.098–0.137 | |  |

1.33 White-naped petrel (*Pterodroma cervicalis*)

Table 65: Raw input data of population parameters of white-naped petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------|---|---------|
| Population (NZ) | 50 000 pairs [1988] | Taylor (2000a) | |
| Age at first reproduction | 6 to 7 years | Grey-faced petrel as proxy; Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Body mass | 438 g | Myhrvold et al. (2015) | |
| Breeding period | October–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

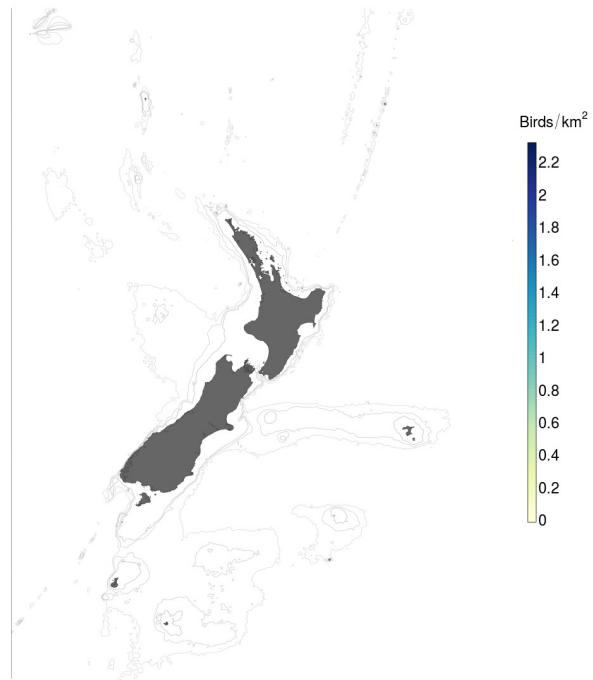

Figure 33: Relative density of white-naped petrel (*Pterodroma cervicalis*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 66: Derived values of population parameters of white-naped petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 6.0–7.0 | Years |  |
| Age at first reproduction (from allometric model) | 5.3 | 4.7–6.0 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.3 | 84.7–97.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.3 | 84.9–97.9 | % |  |
| Optimal adult annual survival rate (from allometric model) | 91.3 | 88.4–93.6 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.3–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 52 400 | 28 100–88 900 | Pairs |  |
| Total population size (from raw input parameters) | 268 000 | 129 000–519 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.104 | 0.090–0.121 | |  |

1.34 Kermadec petrel (*Pterodroma neglecta*)

Table 67: Raw input data of population parameters of Kermadec petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment.

| Parameter | Data | Reference | Quality |
|---------------------------|----------------------|---|---------|
| Population (NZ) | 5 000 to 7 000 pairs | Taylor (2000b) | Poor |
| Age at first reproduction | 6 to 7 years | Grey-faced petrel as proxy; Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Body mass | 485 g | Myhrvold et al. (2015) | |
| Breeding period | All year | G. Taylor (pers. comm.) | |

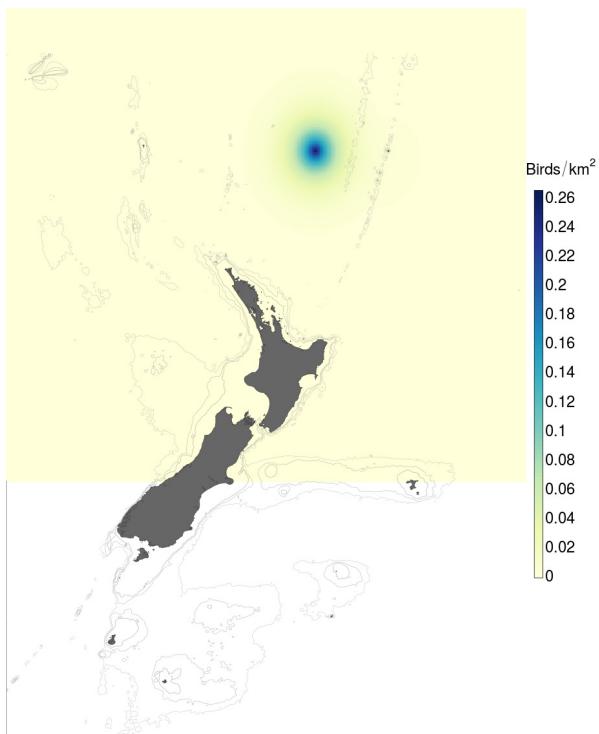

Figure 34: Relative density of Kermadec petrel (*Pterodroma neglecta*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 68: Derived values of population parameters of Kermadec petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

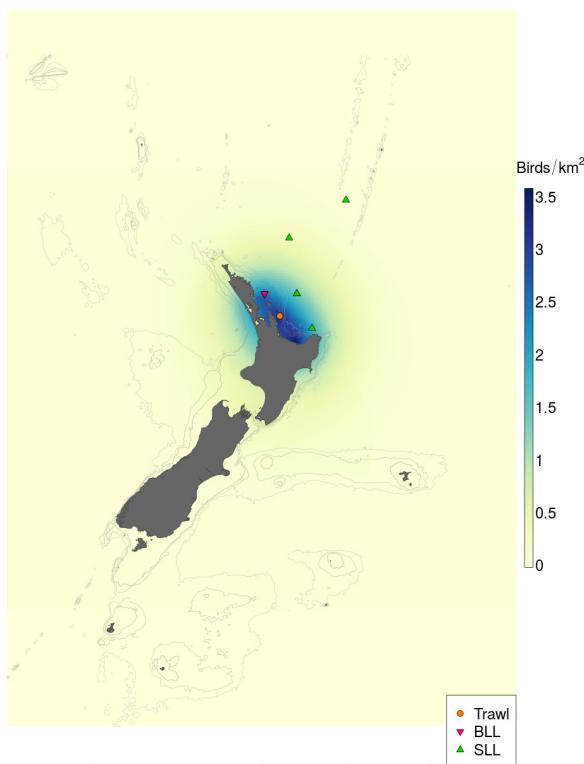

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 6.0–7.0 | Years |  |
| Age at first reproduction (from allometric model) | 5.4 | 4.8–6.1 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.3 | 85.0–97.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.3 | 84.8–97.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 91.5 | 88.8–93.7 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.5–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 5 950 | 5 050–6 940 | Pairs |  |
| Total population size (from raw input parameters) | 30 800 | 20 700–51 300 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.101 | 0.087–0.116 | |  |

1.35 Grey-faced petrel (*Pterodroma macroptera gouldi*)

Table 69: Raw input data of population parameters of grey-faced petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------------|---------------------------|---------|
| Population (NZ) | 200 000 to 300 000 pairs | Taylor (2000b) | Medium |
| Age at first reproduction | 6 to 7 years | Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Marchant & Higgins (1990) | |
| Body mass | 624 g | Myhrvold et al. (2015) | |
| Breeding period | March–January | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 10% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

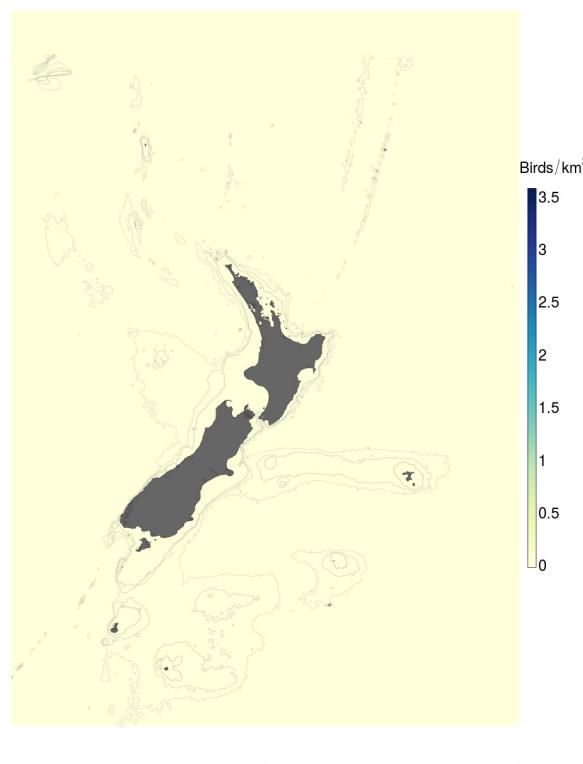

Figure 35: Relative density of grey-faced petrel (*Pterodroma macroptera gouldi*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), and bottom-longline (BLL) fisheries.

Table 70: Derived values of population parameters of grey-faced petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

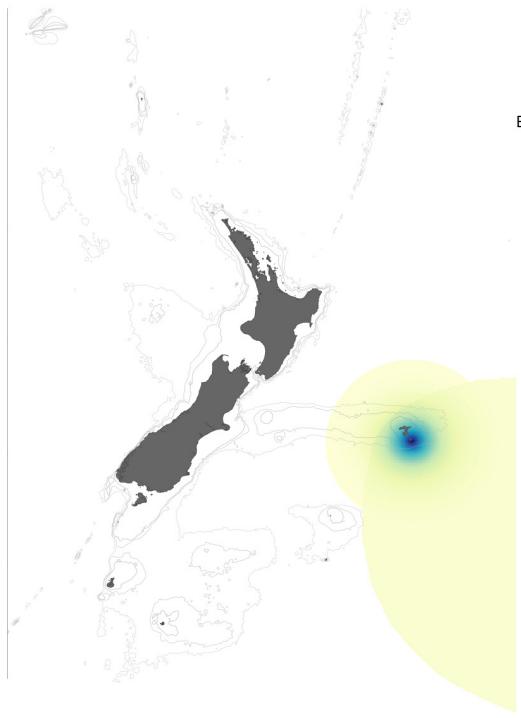

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|-------------------|-------------|--------------|
| Age at first reproduction (from raw input parameters) | 6.5 | 6.0–7.0 | Years | |
| Age at first reproduction (from allometric model) | 5.8 | 5.1–6.5 | Years | |
| Current adult annual survival rate (from raw input parameters) | 93.3 | 84.4–97.8 | % | |
| Optimal adult annual survival rate (from raw input parameters) | 93.3 | 84.8–97.8 | % | |
| Optimal adult annual survival rate (from allometric model) | 92.1 | 89.9–94.0 | % | |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.0–96.3 | % | |
| Annual breeding pairs (from raw input parameters) | 246 000 | 202 000–297 000 | Pairs | |
| Total population size (from raw input parameters) | 1 270 000 | 834 000–2 070 000 | Individuals | |
| Maximum net productivity rate r_{\max} | 0.094 | 0.082–0.107 | | |

1.36 Chatham Island taiko (*Pterodroma magentae*)

Table 71: Raw input data of population parameters of Chatham Island taiko for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------|---|---------|
| Population (NZ) | 17 pairs [2010] | BirdLife International (2012) | High |
| Age at first reproduction | 6 to 7 years | Grey-faced petrel as proxy; Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Body mass | 465 g | Myhrvold et al. (2015) | |
| Breeding period | September–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 20% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

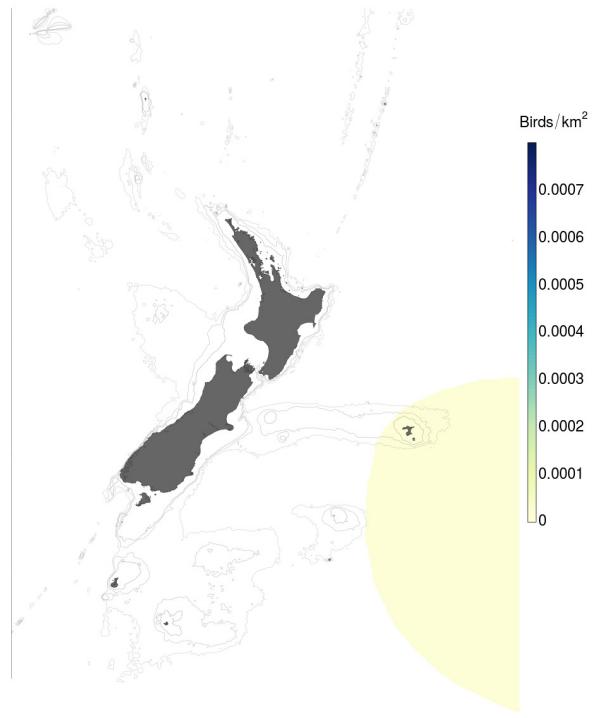

Figure 36: Relative density of Chatham Island taiko (*Pterodroma magentae*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 72: Derived values of population parameters of Chatham Island taiko for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

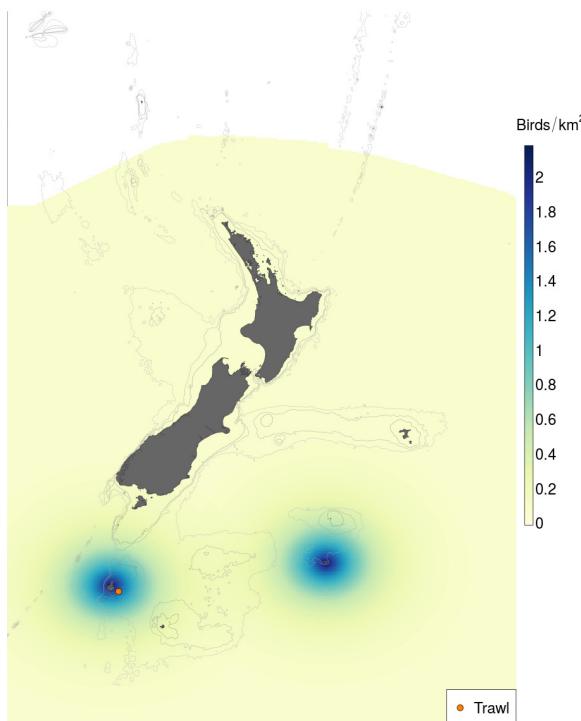

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 6.0–7.0 | Years |  |
| Age at first reproduction (from allometric model) | 5.4 | 4.7–6.1 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.2 | 84.8–97.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.2 | 84.7–97.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 91.4 | 88.8–93.7 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.0–96.2 | % |  |
| Annual breeding pairs (from raw input parameters) | 17 | 14–21 | Pairs |  |
| Total population size (from raw input parameters) | 88 | 58–142 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.103 | 0.088–0.118 | |  |

1.37 White-headed petrel (*Pterodroma lessonii*)

Table 73: Raw input data of population parameters of white-headed petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------|---|---------|
| Population (NZ) | 200 000 pairs | de L. Brooke (2004) | |
| Age at first reproduction | 5.5 years | Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Body mass | 667 g | Myhrvold et al. (2015) | |
| Breeding period | August–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 10% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

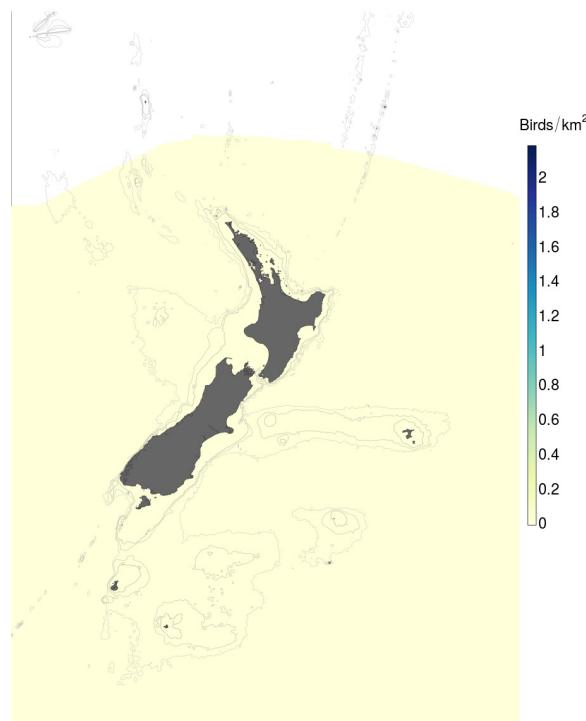

Figure 37: Relative density of white-headed petrel (*Pterodroma lessonii*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl fisheries.

Table 74: Derived values of population parameters of white-headed petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

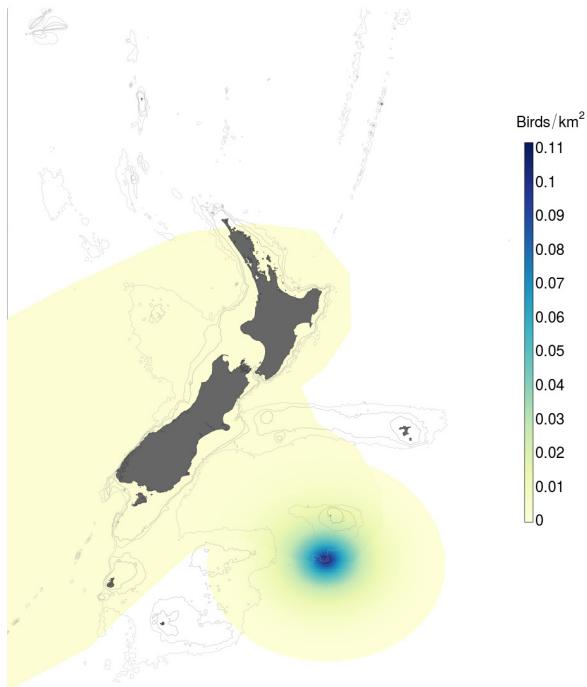

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|-------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 5.5 | 4.1–6.9 | Years |  |
| Age at first reproduction (from allometric model) | 5.9 | 5.2–6.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.3 | 84.6–97.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.3 | 84.9–97.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 92.2 | 90.1–94.1 | % |  |
| Proportion of adults breeding (from raw input parameters) | 60.0 | 49.9–69.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 210 000 | 112 000–371 000 | Pairs |  |
| Total population size (from raw input parameters) | 1 480 000 | 727 000–2 840 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.093 | 0.081–0.105 | |  |

1.38 Soft-plumaged petrel (*Pterodroma mollis*)

Table 75: Raw input data of population parameters of soft-plumaged petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|----------------------|---|---------|
| Population (NZ) | 1 000 to 9 999 pairs | Taylor (2000b) | Poor |
| Age at first reproduction | 6 to 7 years | Grey-faced petrel as proxy; Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Optimal survival rate | 94 % | Grey-faced petrel as proxy; Marchant & Higgins (1990) | |
| Body mass | 312 g | Myhrvold et al. (2015) | |
| Breeding period | September–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

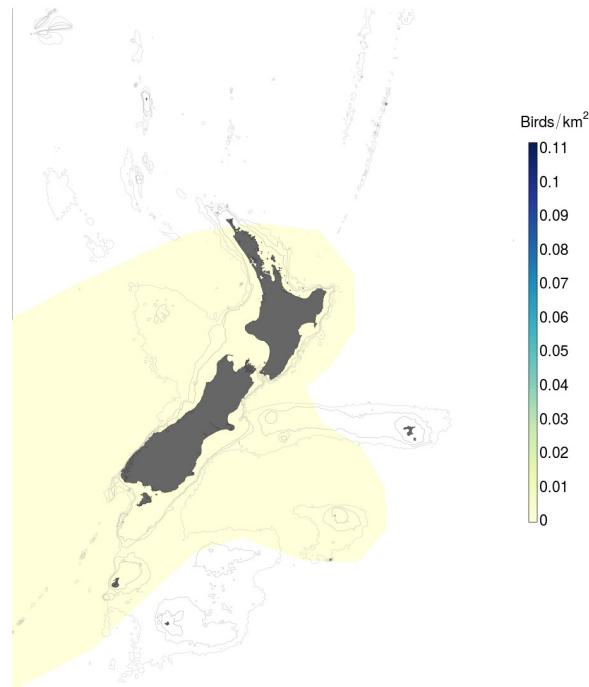

Figure 38: Relative density of soft-plumaged petrel (*Pterodroma mollis*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 76: Derived values of population parameters of soft-plumaged petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

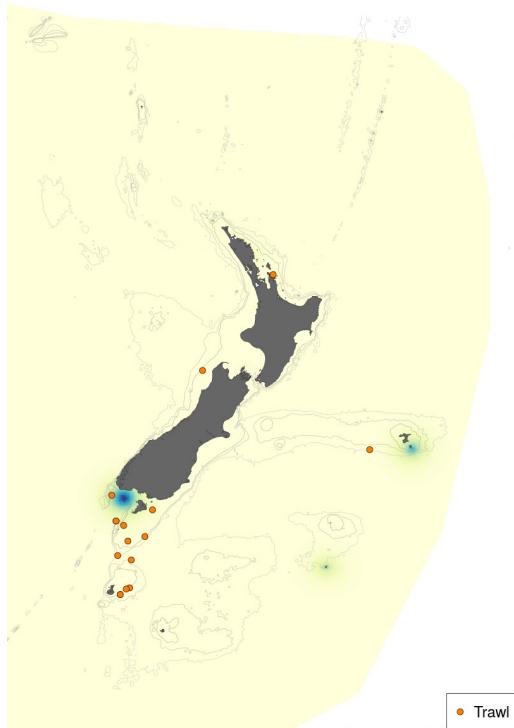

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|--------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 6.5 | 6.0–7.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.9 | 4.2–5.5 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.3 | 84.5–97.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.4 | 85.1–97.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 90.4 | 87.0–93.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.0–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 3 910 | 1 070–9 440 | Pairs |  |
| Total population size (from raw input parameters) | 17 300 | 4 790–44 600 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.116 | 0.098–0.136 | |  |

1.39 Common diving petrel (*Pelecanoides urinatrix*)

Table 77: Raw input data of population parameters of common diving petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|----------------------------|---------------------------|---------|
| Population (NZ) | 300 000 to 2 150 000 pairs | Taylor (2000b) | Poor |
| Age at first reproduction | 2 to 3 years | de L. Brooke (2004) | |
| Current survival rate | 75 to 87 % | Schreiber & Burger (2001) | |
| Optimal survival rate | 75 to 87 % | Schreiber & Burger (2001) | |
| Body mass | 120 g | Myhrvold et al. (2015) | |
| Breeding period | March–January | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 20% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

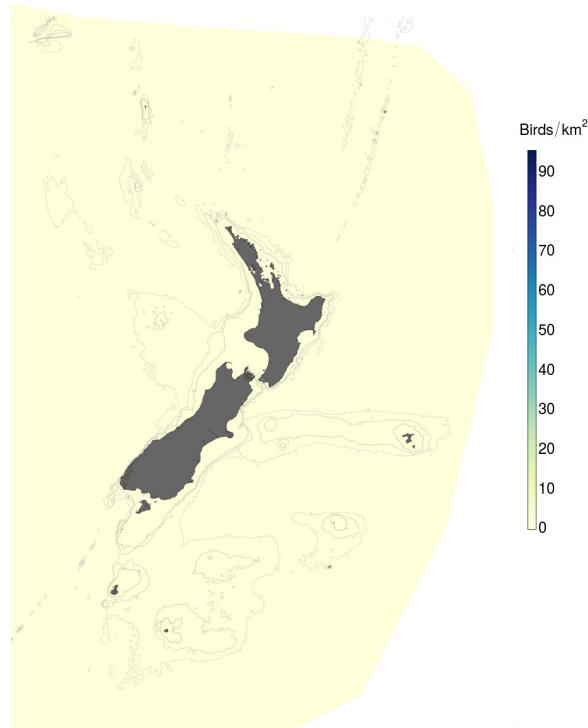

Figure 39: Relative density of common diving petrel (*Pelecanoides urinatrix*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl fisheries.

Table 78: Derived values of population parameters of common diving petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

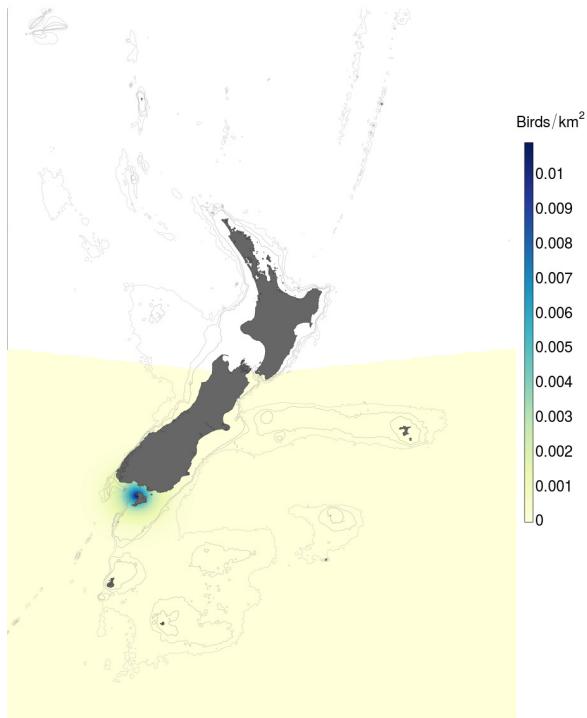

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|---------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 2.5 | 2.0–3.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.8 | 3.2–4.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 81.1 | 75.3–86.7 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 81.0 | 75.3–86.7 | % |  |
| Optimal adult annual survival rate (from allometric model) | 87.7 | 81.4–92.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.7 | 74.1–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 939 000 | 314 000–2 060 000 | Pairs |  |
| Total population size (from raw input parameters) | 3 520 000 | 1 290 000–7 840 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.154 | 0.121–0.191 | |  |

1.40 South Georgian diving petrel (*Pelecanoides georgicus*)

Table 79: Raw input data of population parameters of South Georgian diving petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|--|---------|
| Population (NZ) | 64 pairs [1998] | Taylor (2000b) | |
| Age at first reproduction | 2 to 3 years | Common diving petrel as proxy; de L. Brooke (2004) | |
| Current survival rate | 75 to 87 % | Common diving petrel as proxy; Schreiber & Burger (2001) | |
| Optimal survival rate | 75 to 87 % | Common diving petrel as proxy; Schreiber & Burger (2001) | |
| Body mass | 120 g | Myhrvold et al. (2015) | |
| Breeding period | September–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

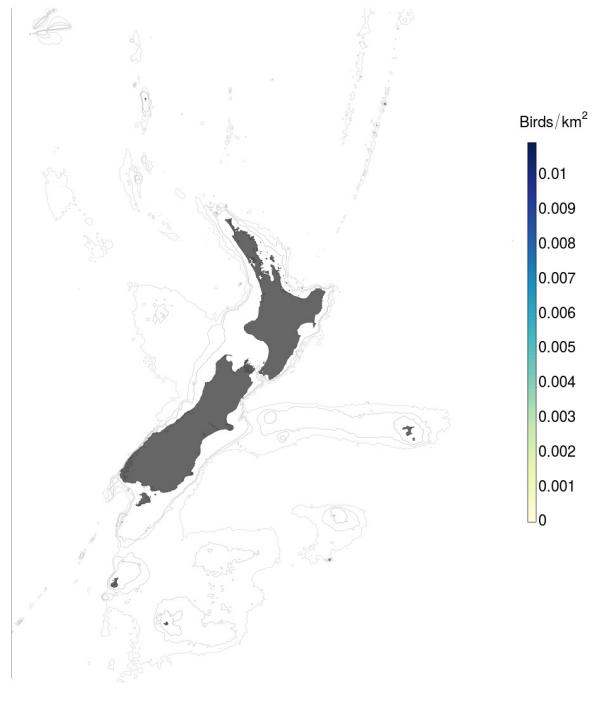

Figure 40: Relative density of South Georgian diving petrel (*Pelecanoides georgicus*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 80: Derived values of population parameters of South Georgian diving petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

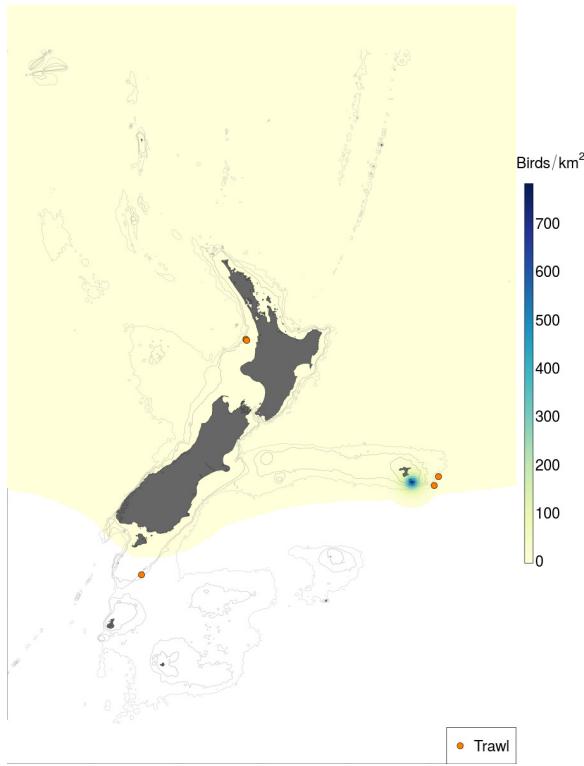

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 2.5 | 2.0–3.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.8 | 3.1–4.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 81.0 | 75.3–86.7 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 80.9 | 75.3–86.7 | % |  |
| Optimal adult annual survival rate (from allometric model) | 87.6 | 81.4–92.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.5–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 67 | 36–114 | Pairs |  |
| Total population size (from raw input parameters) | 263 | 135–470 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.154 | 0.121–0.193 | |  |

1.41 New Zealand white-faced storm petrel (*Pelagodroma marina maoriana*)

Table 81: Raw input data of population parameters of New Zealand white-faced storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------------|--|--------------------------------|
| Population (NZ) | More than 1 000 000 pairs | Taylor (2000b) | Medium |
| Age at first reproduction | 4 to 5 years | Several species as proxy; Croxall (1987) | Croxall de L. Brooke (2004) |
| | More than 3 years | de L. Brooke (2004) | |
| Current survival rate | 90 % | Several species as proxy; Croxall (1987) | Croxall |
| Optimal survival rate | 90 % | Several species as proxy; Croxall (1987) | Croxall |
| Body mass | 44 g | Myhrvold et al. (2015) | |
| Breeding period | September–April | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 0.5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

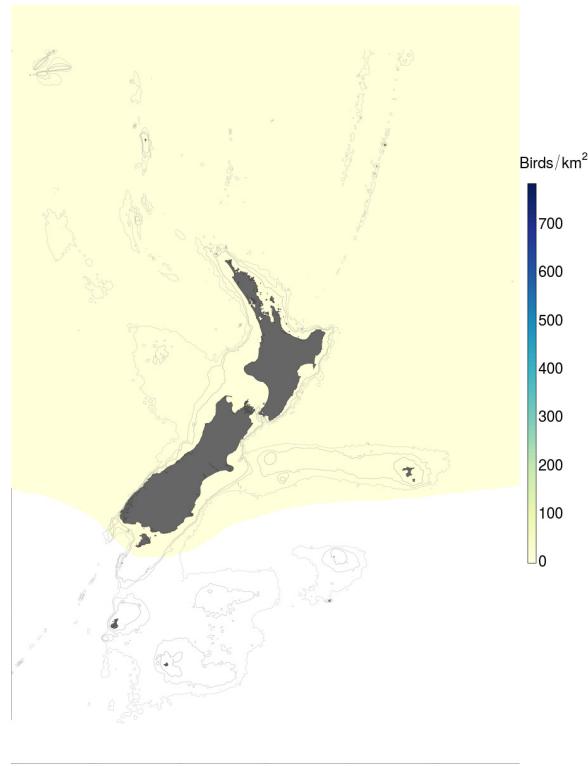

Figure 41: Relative density of New Zealand white-faced storm petrel (*Pelagodroma marina maoriana*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl fisheries.

Table 82: Derived values of population parameters of New Zealand white-faced storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

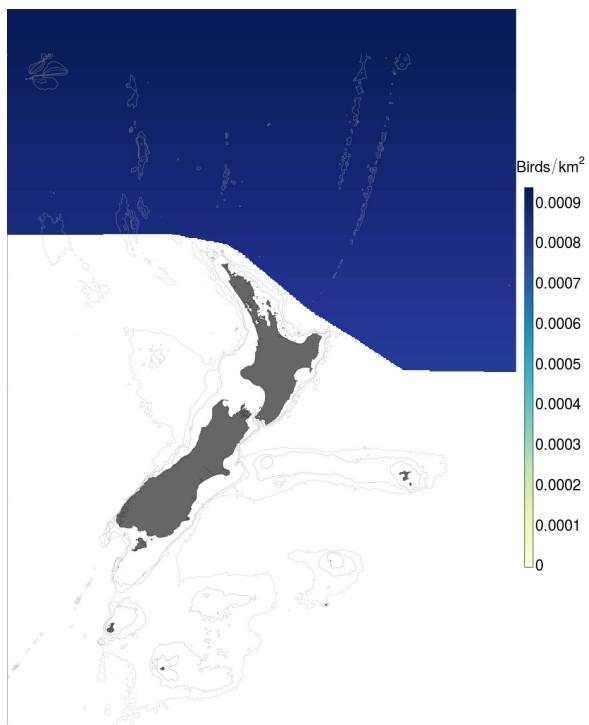

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|----------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.0 | 2.3–3.8 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 89.6 | 82.6–94.5 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 89.6 | 82.4–94.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 84.1 | 73.6–91.6 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.5–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 1 590 000 | 725 000–2 910 000 | Pairs |  |
| Total population size (from raw input parameters) | 6 300 000 | 2 790 000–12 100 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.210 | 0.150–0.286 | |  |

1.42 White-bellied storm petrel (*Fregetta grallaria grallaria*)

Table 83: Raw input data of population parameters of white-bellied storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------|--|----------------|
| Population (NZ) | 1 000 pairs | Taylor (2000a) | Poor |
| Age at first reproduction | 4 to 5 years | Several species as proxy; Croxall (1987) | Croxall (1987) |
| Current survival rate | 90 % | Several species as proxy; Croxall (1987) | Croxall (1987) |
| Optimal survival rate | 90 % | Several species as proxy; Croxall (1987) | Croxall (1987) |
| Body mass | 50 g | Myhrvold et al. (2015) | |
| Breeding period | April–August | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

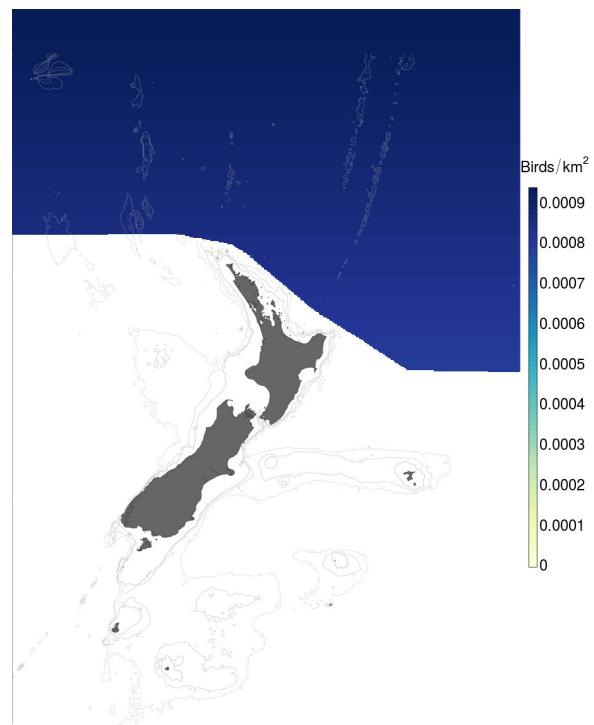

Figure 42: Relative density of white-bellied storm petrel (*Fregetta grallaria grallaria*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 84: Derived values of population parameters of white-bellied storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

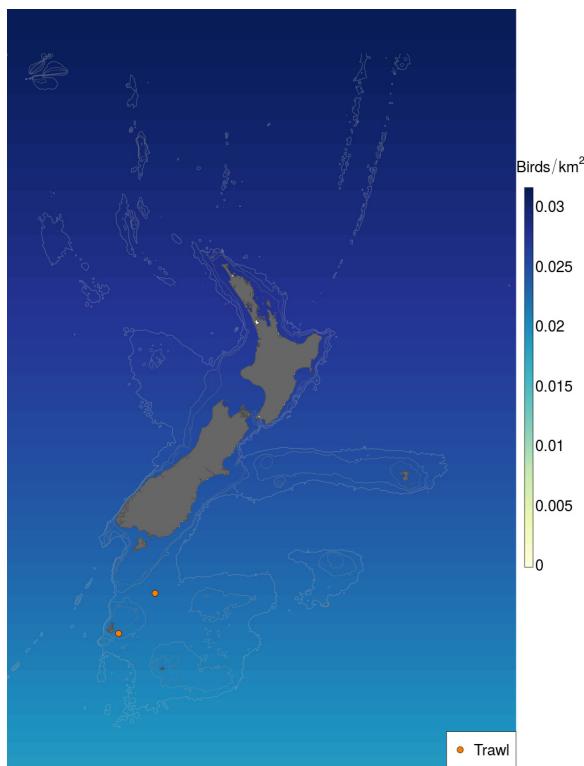

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.5 | 4.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.1 | 2.4–4.0 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 89.6 | 82.3–94.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 89.6 | 82.4–94.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 84.4 | 73.9–91.5 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.7 | 74.6–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 1 050 | 555–1 820 | Pairs |  |
| Total population size (from raw input parameters) | 4 580 | 2 240–8 560 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.202 | 0.147–0.272 | |  |

1.43 Black-bellied storm petrel (*Fregetta tropica*)

Table 85: Raw input data of population parameters of black-bellied storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-------------------------|--|----------------|
| Population (NZ) | 50 000 to 100 000 pairs | Taylor (2000b) | Poor |
| Age at first reproduction | 4 to 5 years | Several species as proxy; Croxall (1987) | Croxall (1987) |
| Current survival rate | 90 % | Several species as proxy; Croxall (1987) | Croxall (1987) |
| Optimal survival rate | 90 % | Several species as proxy; Croxall (1987) | Croxall (1987) |
| Body mass | 53 g | Myhrvold et al. (2015) | |
| Breeding period | October–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 50% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

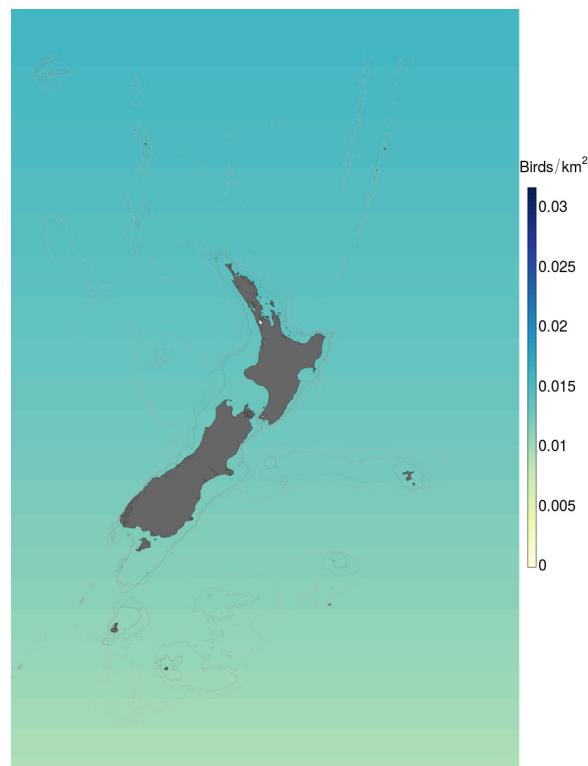

Figure 43: Relative density of black-bellied storm petrel (*Fregetta tropica*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl fisheries.

Table 86: Derived values of population parameters of black-bellied storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

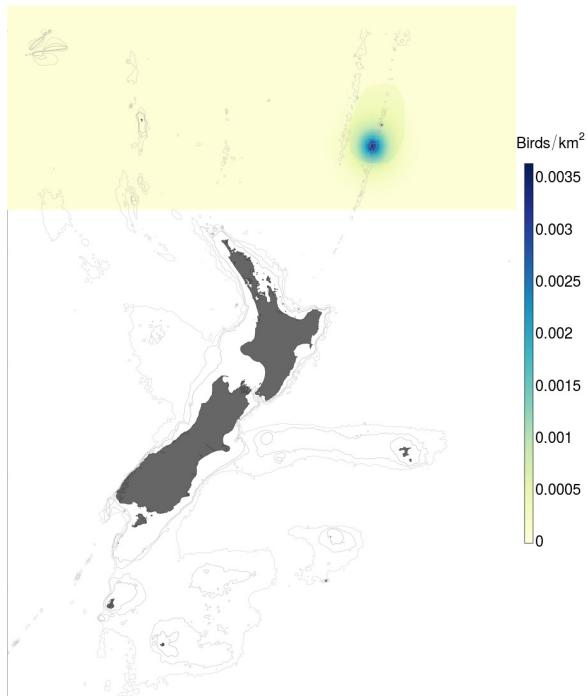

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.5 | 4.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.1 | 2.4–3.9 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 89.6 | 82.5–94.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 89.6 | 82.3–94.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 84.5 | 74.4–91.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.2–96.2 | % |  |
| Annual breeding pairs (from raw input parameters) | 72 300 | 50 900–98 200 | Pairs |  |
| Total population size (from raw input parameters) | 314 000 | 198 000–489 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.199 | 0.146–0.266 | |  |

1.44 Kermadec storm petrel (*Pelagodroma albiclunis*)

Table 87: Raw input data of population parameters of Kermadec storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------|--|--------------------------------|
| Population (NZ) | Less than 100 pairs | Taylor (2000a) | |
| Age at first reproduction | 4 to 5 years | Several species as proxy; Croxall (1987) | Croxall de L. Brooke (2004) |
| | More than 3 years | de L. Brooke (2004) | |
| Current survival rate | 90 % | Several species as proxy; Croxall (1987) | |
| Optimal survival rate | 90 % | Several species as proxy; Croxall (1987) | |
| Body mass | 44 g | Myhrvold et al. (2015) | |
| Breeding period | June–December | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 50% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

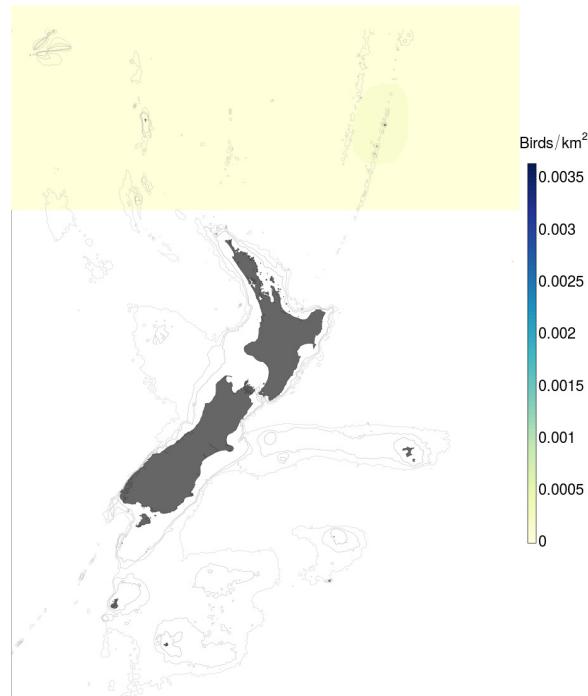

Figure 44: Relative density of Kermadec storm petrel (*Pelagodroma albiclunis*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 88: Derived values of population parameters of Kermadec storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|--------------|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.1–5.0 | Years | |
| Age at first reproduction (from allometric model) | 3.0 | 2.3–3.8 | Years | |
| Current adult annual survival rate (from raw input parameters) | 89.6 | 82.1–94.6 | % | |
| Optimal adult annual survival rate (from raw input parameters) | 89.6 | 82.3–94.5 | % | |
| Optimal adult annual survival rate (from allometric model) | 84.0 | 73.7–91.5 | % | |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 76.4–96.2 | % | |
| Annual breeding pairs (from raw input parameters) | 55 | 21–115 | Pairs | |
| Total population size (from raw input parameters) | 216 | 85–470 | Individuals | |
| Maximum net productivity rate r_{\max} | 0.210 | 0.151–0.281 | | |

1.45 New Zealand storm petrel (*Pealeornis maoriana*)

Table 89: Raw input data of population parameters of New Zealand storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment.

| Parameter | Data | Reference | Quality |
|---------------------------|-------------------|--|----------------|
| Population (NZ) | 20 to 1 000 pairs | NA | Poor |
| Age at first reproduction | 4 to 5 years | Several species as proxy; Croxall (1987) | Croxall (1987) |
| Current survival rate | 90 % | Several species as proxy; Croxall (1987) | Croxall (1987) |
| Optimal survival rate | 90 % | Several species as proxy; Croxall (1987) | Croxall (1987) |
| Body mass | 35 g | Gaskin (2013) | High |
| Breeding period | All year | G. Taylor (pers. comm.) | |

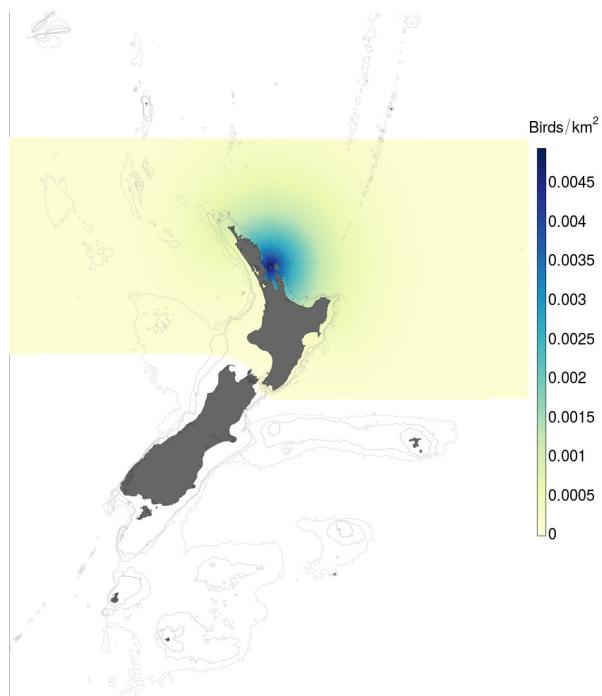

Figure 45: Relative density of New Zealand storm petrel (*Pealeornis maoriana*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 90: Derived values of population parameters of New Zealand storm petrel for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

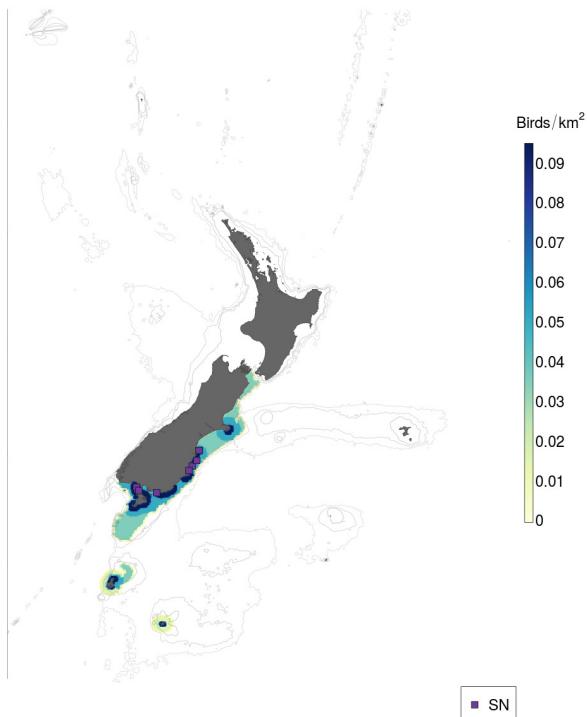

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.5 | 4.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 2.8 | 2.1–3.7 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 89.5 | 82.2–94.5 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 89.7 | 82.6–94.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 83.0 | 70.9–90.6 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 75.4–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 247 | 22–898 | Pairs |  |
| Total population size (from raw input parameters) | 896 | 107–3 290 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.227 | 0.162–0.314 | |  |

1.46 Yellow-eyed penguin (*Megadyptes antipodes*)

Table 91: Raw input data of population parameters of yellow-eyed penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|----------------------|----------------------------|---------|
| Population (NZ) | 1 450 to 1 890 pairs | Ellenberg & Mattern (2012) | Medium |
| Age at first reproduction | 2 to 4 years | Ellenberg & Mattern (2012) | |
| Current survival rate | 87 % | Schreiber & Burger (2001) | |
| Optimal survival rate | 87 % | Schreiber & Burger (2001) | |
| Body mass | 5 328 g | Myhrvold et al. (2015) | |
| Breeding period | August–April | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

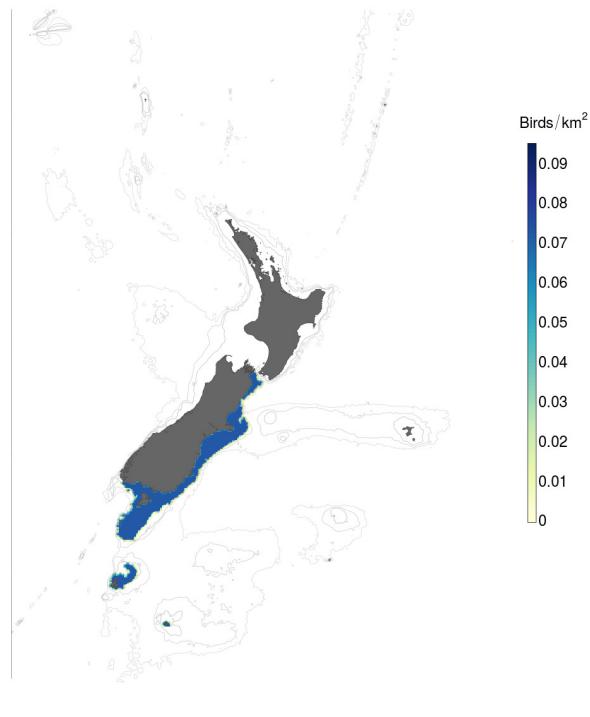

Figure 46: Relative density of yellow-eyed penguin (*Megadyptes antipodes*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in set-net (SN) fisheries.

Table 92: Derived values of population parameters of yellow-eyed penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

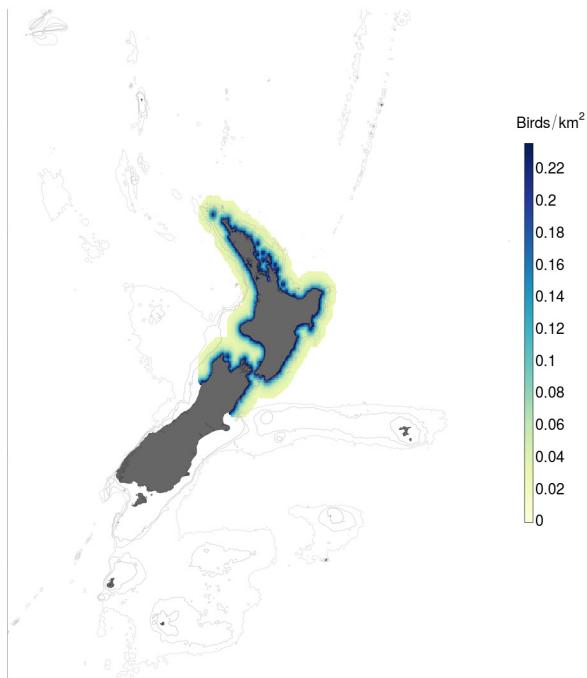

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|--------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 3.0 | 2.0–4.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.4 | 3.4–5.7 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 86.6 | 79.9–91.9 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 86.7 | 79.9–91.9 | % |  |
| Optimal adult annual survival rate (from allometric model) | 88.2 | 83.2–92.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 68.4 | 58.1–77.6 | % |  |
| Annual breeding pairs (from raw input parameters) | 1 660 | 1 460–1 880 | Pairs |  |
| Total population size (from raw input parameters) | 8 510 | 6 160–11 700 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.135 | 0.105–0.171 | |  |

1.47 Northern little penguin (*Eudyptula minor f. iredalei*)

Table 93: Raw input data of population parameters of northern little penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------------------|---------------------------|---------|
| Population (NZ) | 5 000 to 10 000 pairs [1984] | Taylor (2000b) | Poor |
| Age at first reproduction | 2 to 3 years | Schreiber & Burger (2001) | |
| Current survival rate | 83 % | Sidhu et al. (2007) | Medium |
| Optimal survival rate | 83 % | Sidhu et al. (2007) | Medium |
| Body mass | 1 146 g | Myhrvold et al. (2015) | |
| Breeding period | July–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

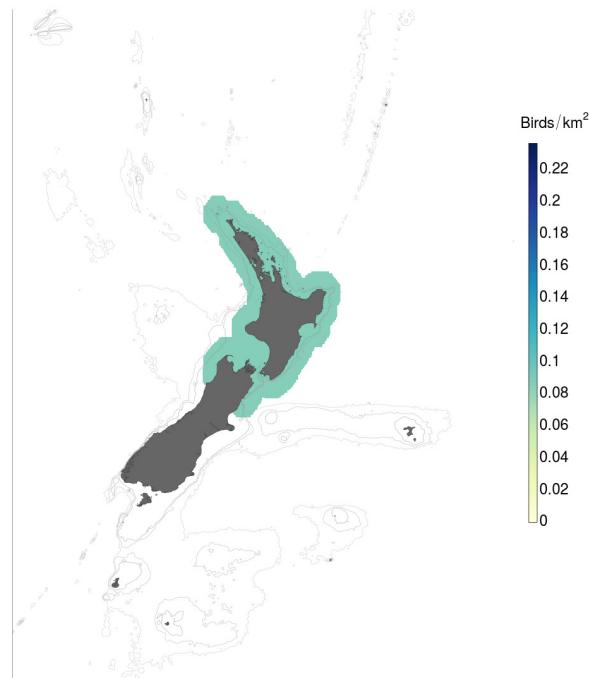

Figure 47: Relative density of northern little penguin (*Eudyptula minor f. iredalei*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 94: Derived values of population parameters of northern little penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

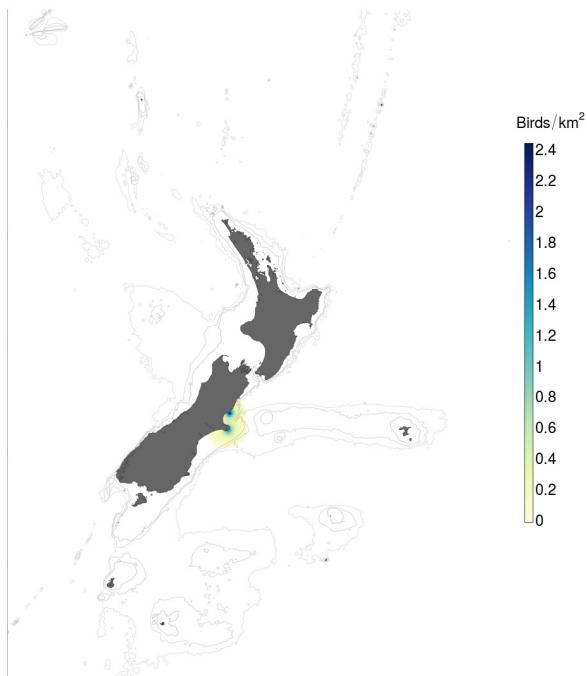

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|--------------|
| Age at first reproduction (from raw input parameters) | 2.5 | 2.0–3.0 | Years | |
| Age at first reproduction (from allometric model) | 3.0 | 2.3–3.9 | Years | |
| Current adult annual survival rate (from raw input parameters) | 82.9 | 78.8–86.5 | % | |
| Optimal adult annual survival rate (from raw input parameters) | 82.9 | 78.6–86.6 | % | |
| Optimal adult annual survival rate (from allometric model) | 82.7 | 75.6–88.4 | % | |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.1–96.4 | % | |
| Annual breeding pairs (from raw input parameters) | 7 220 | 5 080–9 850 | Pairs | |
| Total population size (from raw input parameters) | 28 000 | 18 900–40 400 | Individuals | |
| Maximum net productivity rate r_{\max} | 0.216 | 0.165–0.280 | | |

1.48 White-flippered little penguin (*Eudyptula minor f. albosignata*)

Table 95: Raw input data of population parameters of white-flippered little penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|---------------------------|---------|
| Population (NZ) | 2 200 pairs [1998] | Taylor (2000a) | Medium |
| Age at first reproduction | 2 to 3 years | Schreiber & Burger (2001) | |
| Current survival rate | 83 % | Sidhu et al. (2007) | Medium |
| Optimal survival rate | 83 % | Sidhu et al. (2007) | Medium |
| Body mass | 1 146 g | Myhrvold et al. (2015) | |
| Breeding period | July–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

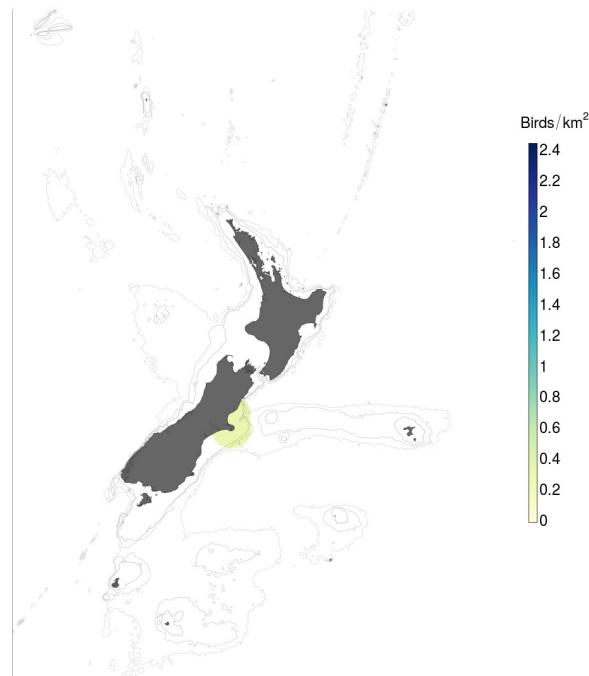

Figure 48: Relative density of white-flippered little penguin (*Eudyptula minor f. albosignata*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 96: Derived values of population parameters of white-flipped little penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

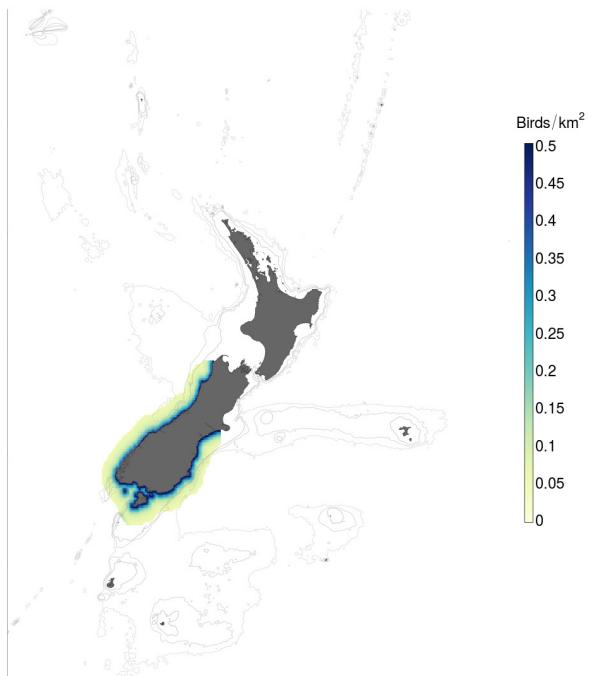

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|--------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 2.5 | 2.0–3.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.0 | 2.3–3.8 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 82.9 | 78.6–86.5 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 83.0 | 78.7–86.5 | % |  |
| Optimal adult annual survival rate (from allometric model) | 82.7 | 76.0–88.3 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 75.4–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 2 240 | 1 470–3 290 | Pairs |  |
| Total population size (from raw input parameters) | 8 630 | 5 520–13 100 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.216 | 0.167–0.276 | |  |

1.49 Southern little penguin (*Eudyptula minor f. minor*)

Table 97: Raw input data of population parameters of southern little penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------------------|---------------------------|---------|
| Population (NZ) | 5 000 to 10 000 pairs [1984] | Taylor (2000b) | Poor |
| Age at first reproduction | 2 to 3 years | Schreiber & Burger (2001) | |
| Current survival rate | 83 % | Sidhu et al. (2007) | Medium |
| Optimal survival rate | 83 % | Sidhu et al. (2007) | Medium |
| Body mass | 1 146 g | NA | |
| Breeding period | July–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

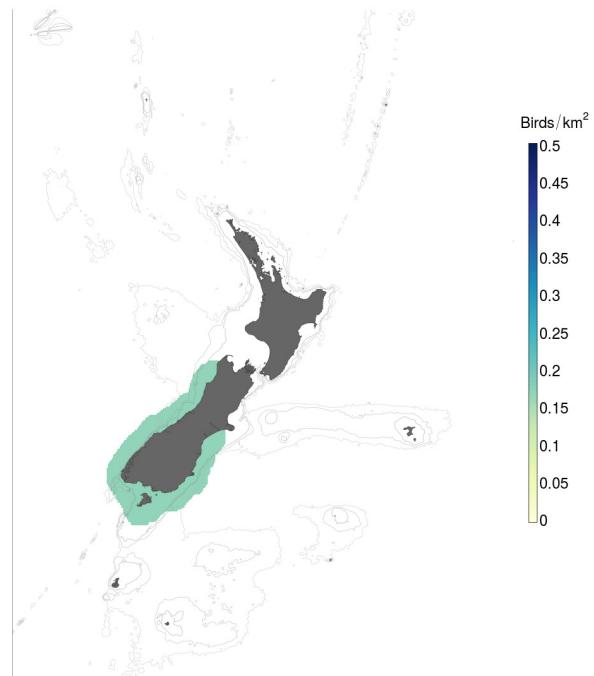

Figure 49: Relative density of southern little penguin (*Eudyptula minor f. minor*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 98: Derived values of population parameters of southern little penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

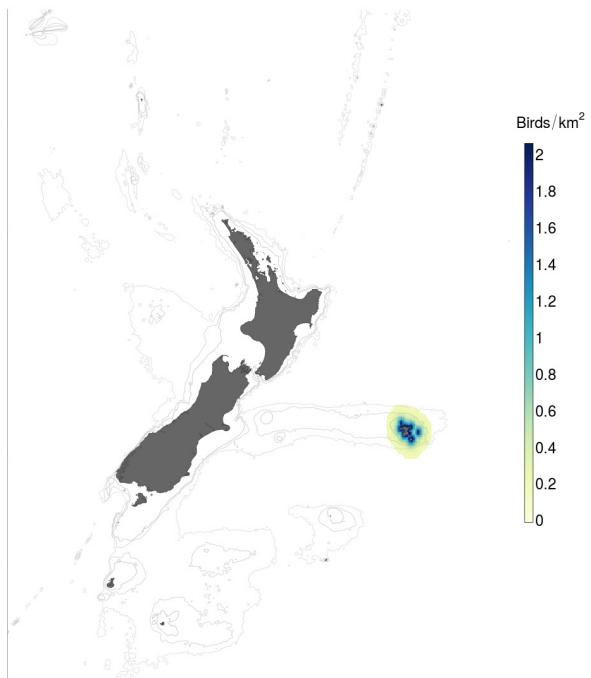

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 2.5 | 2.0–3.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.0 | 2.3–3.8 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 82.9 | 78.7–86.5 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 82.9 | 78.7–86.5 | % |  |
| Optimal adult annual survival rate (from allometric model) | 82.7 | 76.1–88.3 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.7–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 7 220 | 5 100–9 840 | Pairs |  |
| Total population size (from raw input parameters) | 28 200 | 18 600–41 400 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.216 | 0.165–0.277 | |  |

1.50 Chatham Island little penguin (*Eudyptula minor f. chathamensis*)

Table 99: Raw input data of population parameters of Chatham Island little penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------------------|---------------------------|---------|
| Population (NZ) | 5 000 to 10 000 pairs [1984] | Taylor (2000b) | Poor |
| Age at first reproduction | 2 to 3 years | Schreiber & Burger (2001) | |
| Current survival rate | 83 % | Sidhu et al. (2007) | Medium |
| Optimal survival rate | 83 % | Sidhu et al. (2007) | Medium |
| Body mass | 1 146 g | Myhrvold et al. (2015) | |
| Breeding period | July–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

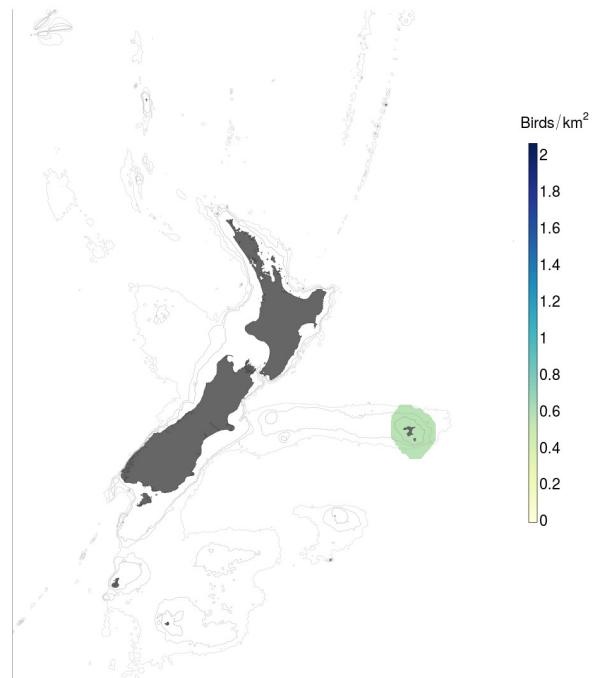

Figure 50: Relative density of Chatham Island little penguin (*Eudyptula minor f. chathamensis*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 100: Derived values of population parameters of Chatham Island little penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

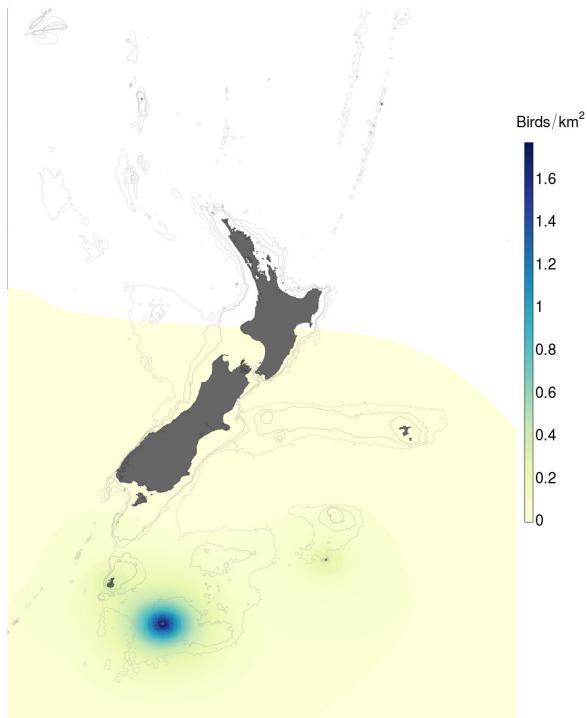

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 2.5 | 2.0–3.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.0 | 2.3–3.9 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 82.9 | 78.6–86.7 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 82.9 | 78.6–86.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 82.7 | 76.2–88.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 75.0–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 7 230 | 5 080–9 830 | Pairs |  |

1.51 Eastern rockhopper penguin (*Eudyptes chrysocome filholi*)

Table 101: Raw input data of population parameters of eastern rockhopper penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------------|--|---------|
| Population (NZ) | 38 961 to 58 500 pairs | Taylor (2000a) | |
| Age at first reproduction | 4.7 years | Moseley’s rockhopper penguin as proxy; Guinard et al. (1998) | |
| Current survival rate | 84 ± 1.1 % [1995] | Northern rockhopper penguin as proxy; Guinard et al. (1998) | |
| Optimal survival rate | 84 ± 1.1 % [1995] | Northern rockhopper penguin as proxy; Guinard et al. (1998) | |
| Body mass | 2 480 g | Myhrvold et al. (2015) | |
| Breeding period | October–May | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

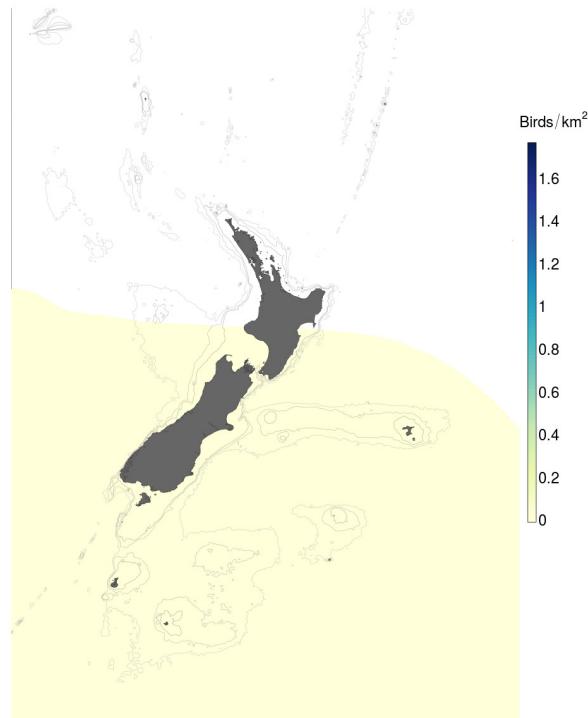

Figure 51: Relative density of eastern rockhopper penguin (*Eudyptes chrysocome filholi*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 102: Derived values of population parameters of eastern rockhopper penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

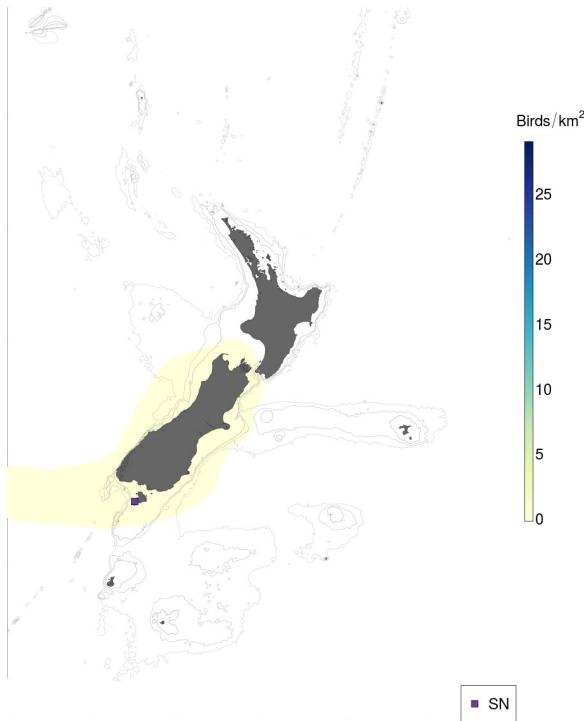

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-----------------|-------------|--------------|
| Age at first reproduction (from raw input parameters) | 4.5 | 3.1–5.9 | Years | |
| Age at first reproduction (from allometric model) | 3.7 | 2.8–4.7 | Years | |
| Current adult annual survival rate (from raw input parameters) | 84.0 | 81.6–86.0 | % | |
| Optimal adult annual survival rate (from raw input parameters) | 84.0 | 81.8–86.1 | % | |
| Optimal adult annual survival rate (from allometric model) | 85.7 | 80.2–90.1 | % | |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 76.1–96.3 | % | |
| Annual breeding pairs (from raw input parameters) | 48 200 | 39 400–58 000 | Pairs | |
| Total population size (from raw input parameters) | 262 000 | 175 000–387 000 | Individuals | |
| Maximum net productivity rate r_{\max} | 0.170 | 0.132–0.217 | | |

1.52 Fiordland crested penguin (*Eudyptes pachyrhynchus*)

Table 103: Raw input data of population parameters of Fiordland crested penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------------|--|---------|
| Population (NZ) | 3 000 pairs | Roots (2006) | |
| Age at first reproduction | 5 to 6 years | Marchant & Higgins (1990) | Poor |
| | 3 to 4 years | Schreiber & Burger (2001) | |
| Current survival rate | $84 \pm 1.1\% [1995]$ | Northern rockhopper penguin as proxy; Guinard et al. (1998) | |
| Optimal survival rate | $84 \pm 1.1\% [1995]$ | Northern rockhopper penguin as proxy; Guinard et al. (1998) | |
| Body mass | 3 775 g | Myhrvold et al. (2015) | |
| Breeding period | July–March | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 50% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

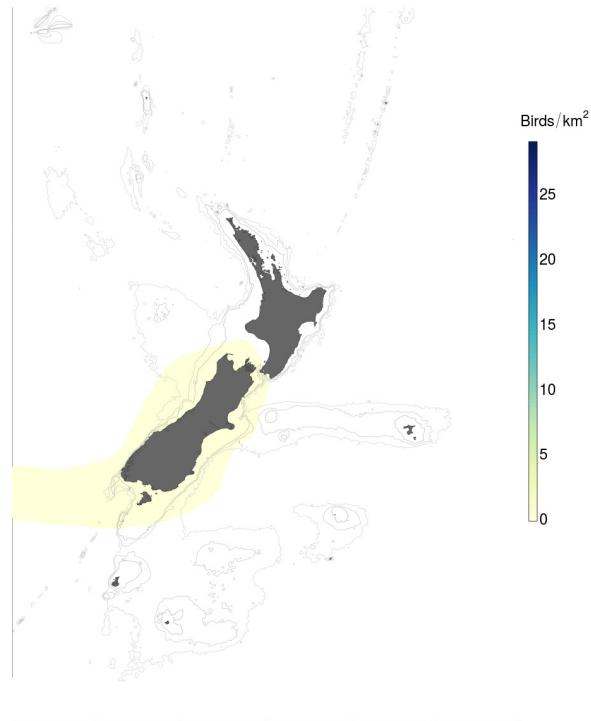

Figure 52: Relative density of Fiordland crested penguin (*Eudyptes pachyrhynchus*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in set-net (SN) fisheries.

Table 104: Derived values of population parameters of Fiordland crested penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

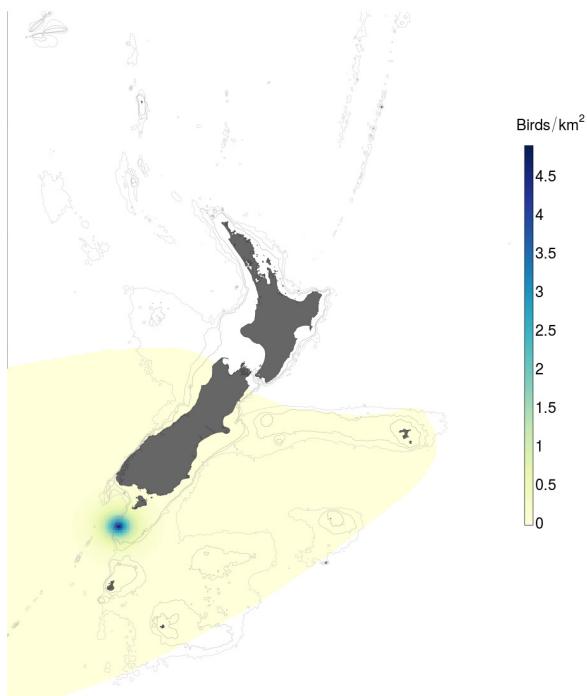

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|--------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.5 | 3.1–5.9 | Years |  |
| Age at first reproduction (from allometric model) | 4.1 | 3.2–5.2 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 84.0 | 81.8–86.1 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 84.0 | 81.8–86.1 | % |  |
| Optimal adult annual survival rate (from allometric model) | 87.1 | 82.2–91.2 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.3–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 3 160 | 1 660–5 440 | Pairs |  |
| Total population size (from raw input parameters) | 17 000 | 8 470–31 300 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.149 | 0.116–0.187 | |  |

1.53 Snares crested penguin (*Eudyptes robustus*)

Table 105: Raw input data of population parameters of Snares crested penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------------|--|---------|
| Population () | 24 666 to 30 672 pairs | Hiscock & Chilvers (2016) | High |
| Age at first reproduction | 5 to 6 years | Roots (2006) | |
| Current survival rate | $84 \pm 1.1\% [1995]$ | Northern rockhopper penguin as proxy; Guinard et al. (1998) | |
| Optimal survival rate | $84 \pm 1.1\% [1995]$ | Northern rockhopper penguin as proxy; Guinard et al. (1998) | |
| Body mass | 3 336 g | Myhrvold et al. (2015) | |
| Breeding period | September–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 5% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

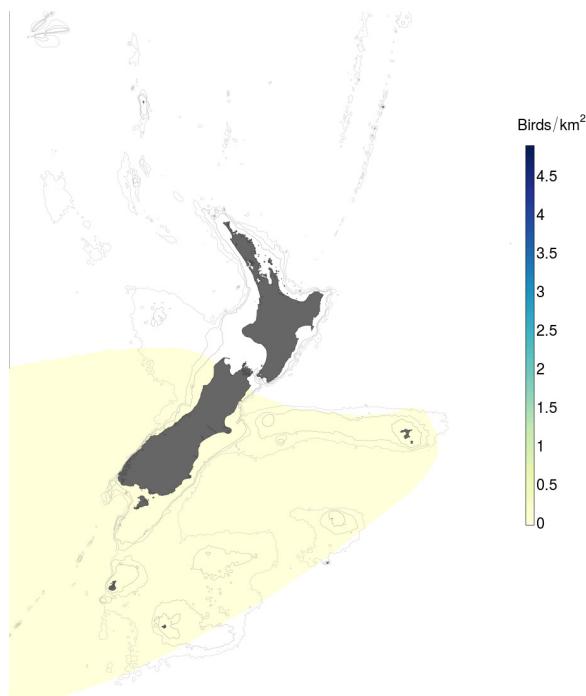

Figure 53: Relative density of Snares crested penguin (*Eudyptes robustus*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 106: Derived values of population parameters of Snares crested penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

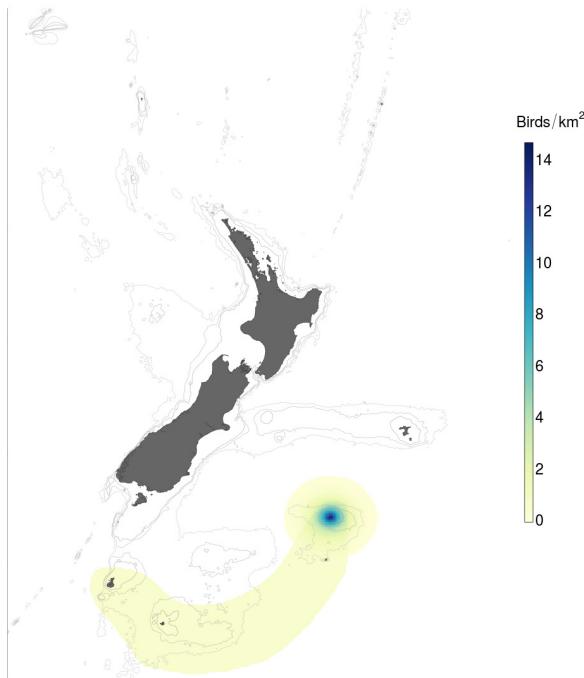

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 5.5 | 5.0–6.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.0 | 3.1–5.0 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 84.0 | 81.8–86.0 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 84.0 | 81.8–86.1 | % |  |
| Optimal adult annual survival rate (from allometric model) | 86.8 | 81.8–91.0 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.1 | 75.6–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 27 500 | 24 800–30 500 | Pairs |  |
| Total population size (from raw input parameters) | 177 000 | 138 000–231 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.155 | 0.121–0.197 | |  |

1.54 Erect-crested penguin (*Eudyptes sclateri*)

Table 107: Raw input data of population parameters of erect-crested penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------------------|---|---------|
| Population (NZ) | 81 000 (77 000–85 000) pairs | Taylor (2000a) | |
| Age at first reproduction | 5 to 6 years | Fiordland crested penguin as proxy; Roots (2006) | |
| Current survival rate | 84 ± 1.1 % [1995] | Northern rockhopper penguin as proxy; Guinard et al. (1998) | |
| Optimal survival rate | 84 ± 1.1 % [1995] | Northern rockhopper penguin as proxy; Guinard et al. (1998) | |
| Body mass | 5 212 g | Myhrvold et al. (2015) | |
| Breeding period | September–March | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 50% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

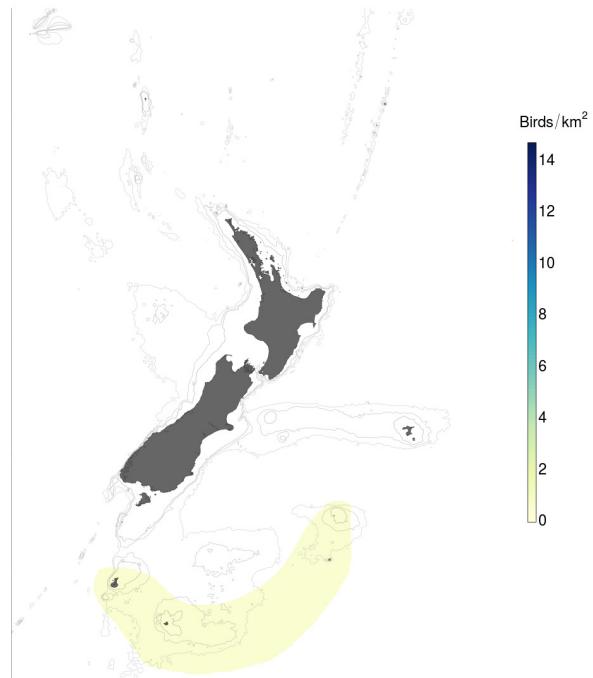

Figure 54: Relative density of erect-crested penguin (*Eudyptes sclateri*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 108: Derived values of population parameters of erect-crested penguin for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

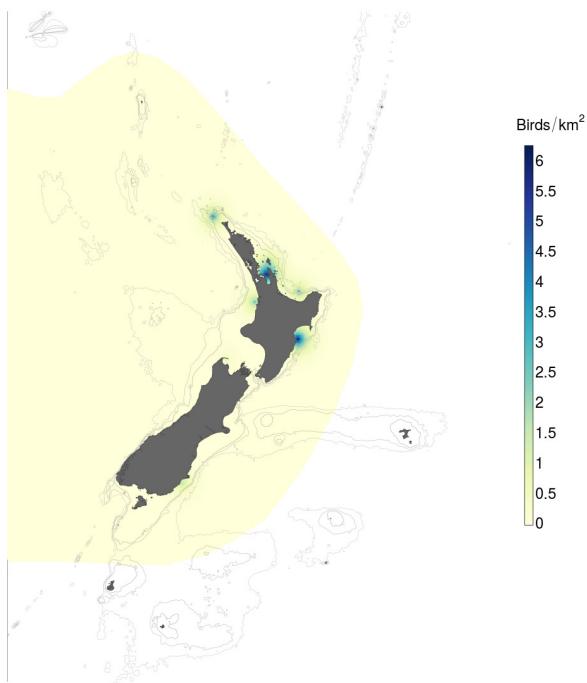

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|-----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 5.5 | 5.0–6.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.4 | 3.4–5.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 84.0 | 81.6–86.0 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 84.0 | 81.7–86.0 | % |  |
| Optimal adult annual survival rate (from allometric model) | 88.2 | 83.4–92.0 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.2–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 81 000 | 77 200–84 800 | Pairs |  |
| Total population size (from raw input parameters) | 525 000 | 419 000–667 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.135 | 0.107–0.171 | |  |

1.55 Australasian gannet (*Morus serrator*)

Table 109: Raw input data of population parameters of Australasian gannet for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------|---|---------|
| Population (NZ) | 46 004 pairs [1981] | Wodzicki et al. (1984) | |
| Age at first reproduction | 3 to 7 years | Schreiber & Burger (2001) | |
| Current survival rate | 94 % | Northern gannet as proxy; Schreiber & Burger (2001) | |
| Optimal survival rate | 94 % | Northern gannet as proxy; Schreiber & Burger (2001) | |
| Body mass | 2 274 g | Myhrvold et al. (2015) | |
| Breeding period | August–March | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 20% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

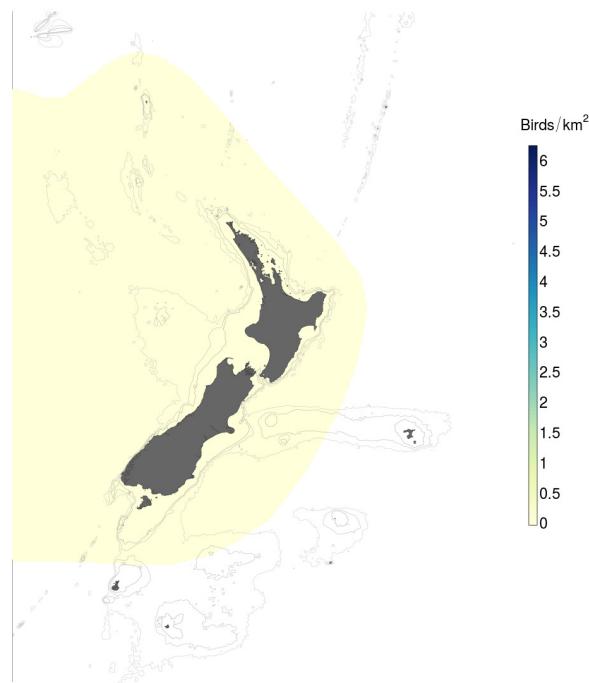

Figure 55: Relative density of Australasian gannet (*Morus serrator*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 110: Derived values of population parameters of Australasian gannet for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|---------|----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 5.0 | 3.1–6.9 | Years |  |
| Age at first reproduction (from allometric model) | 3.2 | 2.4–4.4 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 93.4 | 85.0–97.8 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 93.3 | 84.5–97.8 | % |  |
| Optimal adult annual survival rate (from allometric model) | 85.8 | 77.1–92.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.6–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 48 500 | 26 000–84 100 | Pairs |  |
| Total population size (from raw input parameters) | 200 000 | 97 600–380 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.189 | 0.133–0.260 | |  |

1.56 Masked booby (*Sula dactylatra*)

Table 111: Raw input data of population parameters of masked booby for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment.

| Parameter | Data | Reference | Quality |
|---------------------------|--------------|---------------------------|---------|
| Population (NZ) | 240 pairs | Veitch et al. (2004) | Medium |
| Age at first reproduction | 2 to 4 years | Schreiber & Burger (2001) | |
| Current survival rate | 85 % [1979] | Harris (1979) | Poor |
| Optimal survival rate | 85 % [1979] | Harris (1979) | Poor |
| Body mass | 1 971 g | Myhrvold et al. (2015) | |
| Breeding period | All year | G. Taylor (pers. comm.) | |

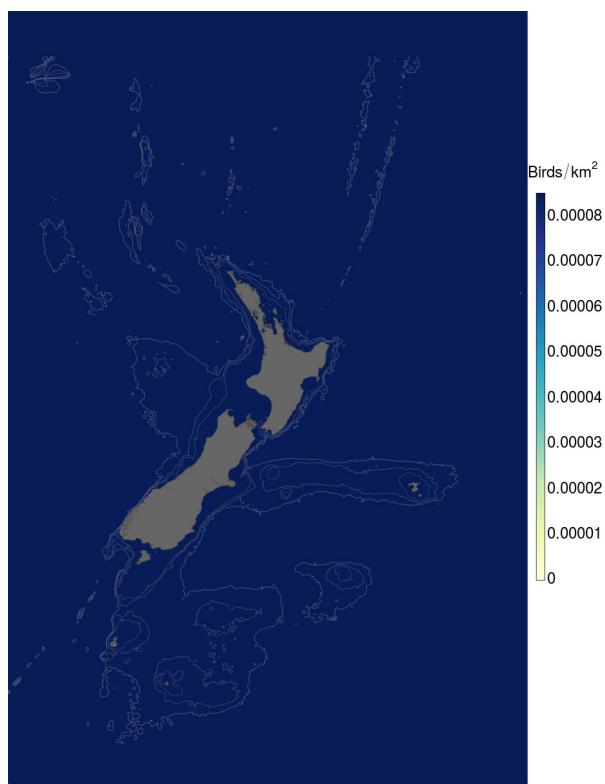

Figure 56: Relative density of masked booby (*Sula dactylatra*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 112: Derived values of population parameters of masked booby for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 3.0 | 2.0–3.9 | Years |  |
| Age at first reproduction (from allometric model) | 3.1 | 2.3–4.2 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 84.8 | 78.1–90.0 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 84.7 | 78.1–90.1 | % |  |
| Optimal adult annual survival rate (from allometric model) | 85.3 | 76.1–92.1 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 76.0–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 245 | 162–358 | Pairs |  |
| Total population size (from raw input parameters) | 1 060 | 645–1 690 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.196 | 0.138–0.271 | |  |

1.57 Pied shag (*Phalacrocorax varius varius*)

Table 113: Raw input data of population parameters of pied shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|--|---------|
| Population (NZ) | 6 400 pairs [2013] | Bell (2013) | High |
| Age at first reproduction | More than 2 years | Schreiber & Burger (2001) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 1 750 g | Myhrvold et al. (2015) | |
| Breeding period | All year | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

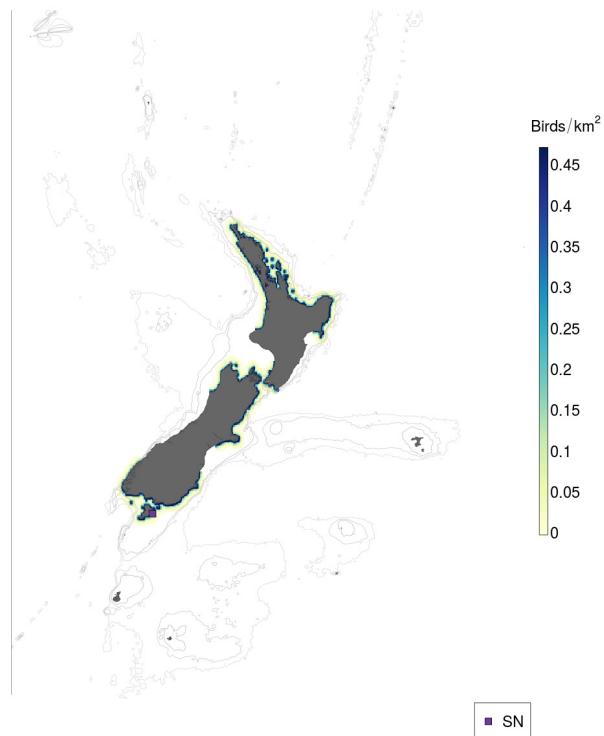

Figure 57: Relative density of pied shag (*Phalacrocorax varius varius*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in set-net (SN) fisheries.

Table 114: Derived values of population parameters of pied shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

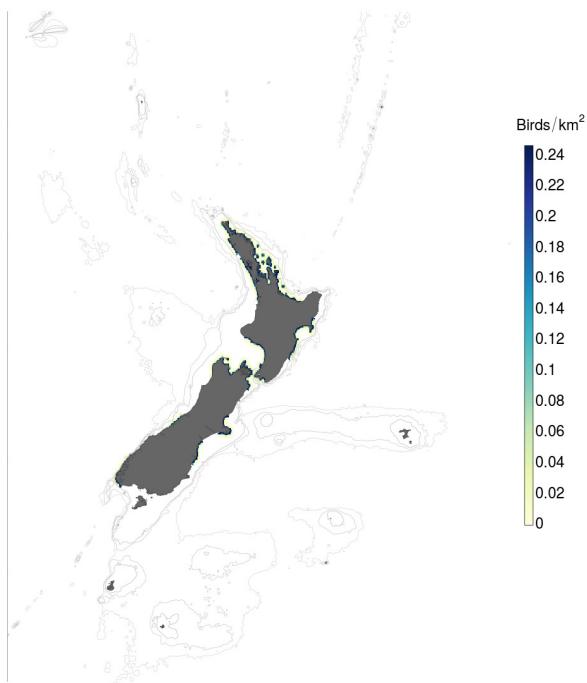

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|---------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 2.7 | 2.0–3.3 | Years |  |
| Age at first reproduction (from allometric model) | 3.0 | 2.2–4.1 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 84.9 | 75.5–91.7 | % |  |
| Proportion of adults breeding (from raw input parameters) | 100.0 | 100.0–100.0 | % |  |
| Annual breeding pairs (from raw input parameters) | 6 430 | 5 280–7 760 | Pairs |  |
| Total population size (from raw input parameters) | 21 800 | 17 000–28 500 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.205 | 0.142–0.286 | |  |

1.58 Little black shag (*Phalacrocorax sulcirostris*)

Table 115: Raw input data of population parameters of little black shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|--|---------|
| Population (NZ) | 1 500 pairs | Walker et al. (2015) | Poor |
| Age at first reproduction | 2 years | NA | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 1 000 g | Myhrvold et al. (2015) | |
| Breeding period | October–December | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

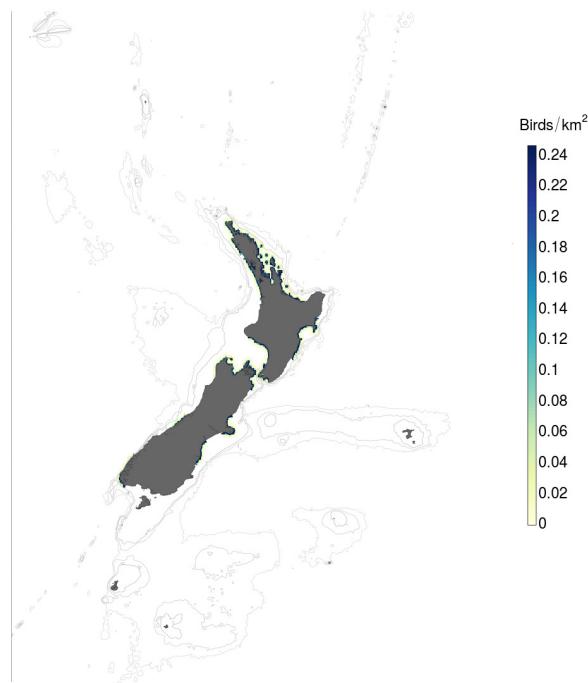

Figure 58: Relative density of little black shag (*Phalacrocorax sulcirostris*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 116: Derived values of population parameters of little black shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

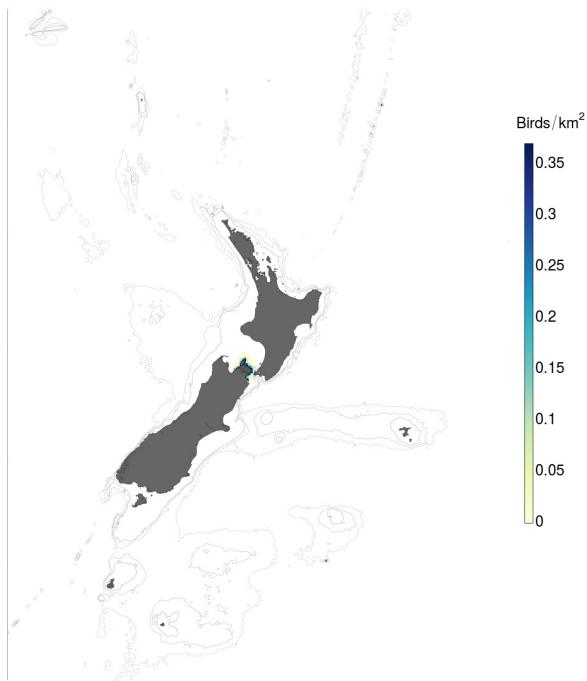

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 2.0 | 1.1–2.9 | Years |  |
| Age at first reproduction (from allometric model) | 2.6 | 1.9–3.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 82.7 | 72.0–90.5 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.1–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 1 570 | 835–2 770 | Pairs |  |
| Total population size (from raw input parameters) | 5 510 | 2 800–9 820 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.245 | 0.169–0.349 | |  |

1.59 New Zealand king shag (*Leucocarbo carunculatus*)

Table 117: Raw input data of population parameters of New Zealand king shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|--|---------|
| Population (NZ) | 187 pairs [2015] | Schuckard et al. (2015) | High |
| Age at first reproduction | More than 3 years | R. Powlesland (pers. comm.) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 2 578 g | Myhrvold et al. (2015) | |
| Breeding period | March–October | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

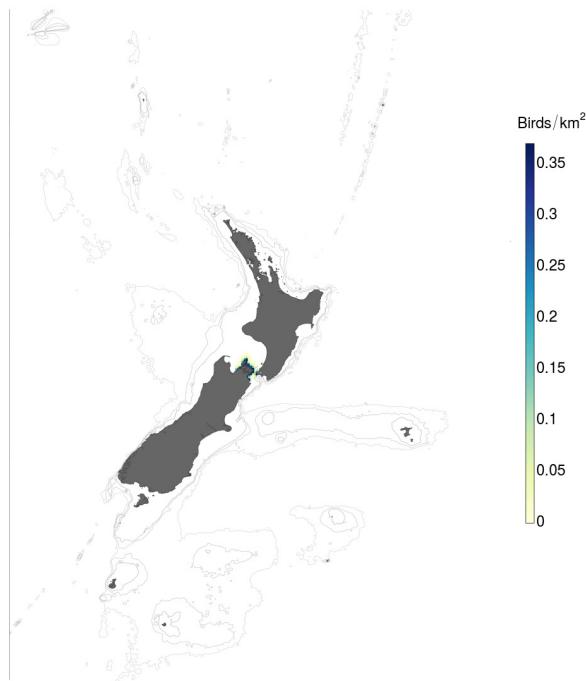

Figure 59: Relative density of New Zealand king shag (*Leucocarbo carunculatus*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 118: Derived values of population parameters of New Zealand king shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

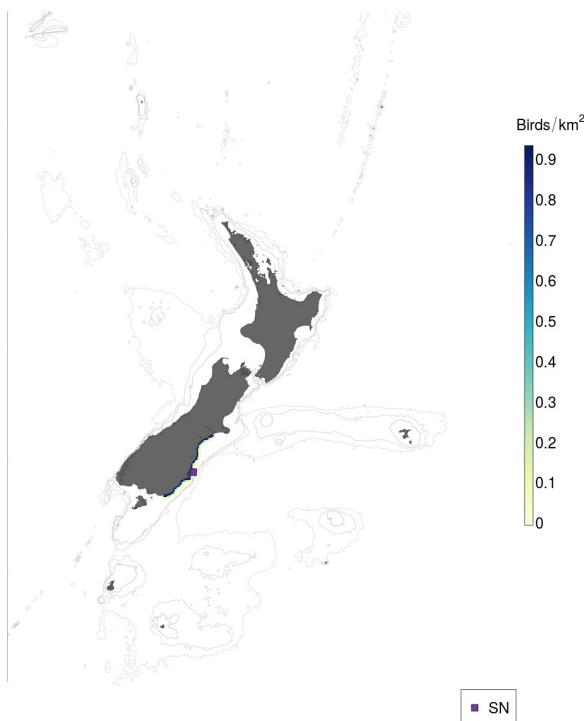

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.3 | 2.4–4.6 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 86.3 | 78.1–92.7 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 74.7–96.6 | % |  |
| Annual breeding pairs (from raw input parameters) | 188 | 153–227 | Pairs |  |
| Total population size (from raw input parameters) | 861 | 621–1 190 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.182 | 0.129–0.253 | |  |

1.60 Otago shag (*Leucocarbo chalconotus*)

Table 119: Raw input data of population parameters of Otago shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------------------|--|---------|
| Population (NZ) | 1 230 to 1 400 pairs [2016] | C. Lalas (pers. comm.) | High |
| Age at first reproduction | More than 3 years | R. Powlesland (pers. comm.) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 2 295 g | Myhrvold et al. (2015) | |
| Breeding period | August–March | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

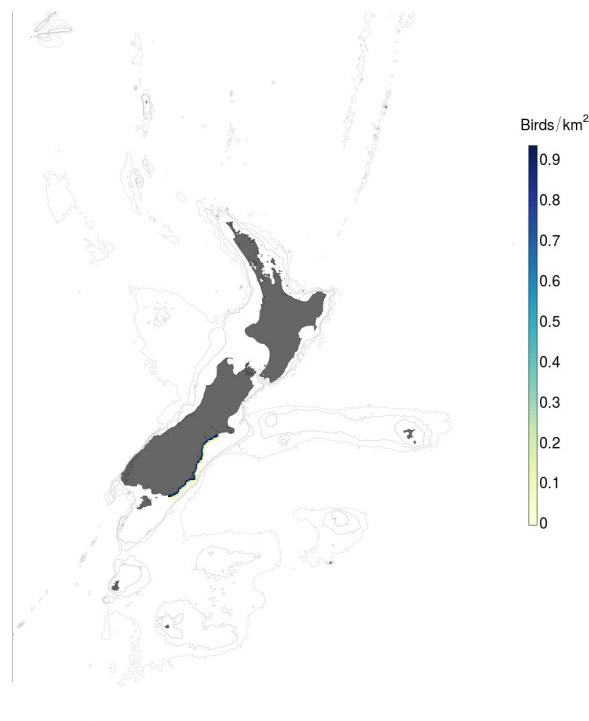

Figure 60: Relative density of Otago shag (*Leucocarbo chalconotus*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in set-net (SN) fisheries.

Table 120: Derived values of population parameters of Otago shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

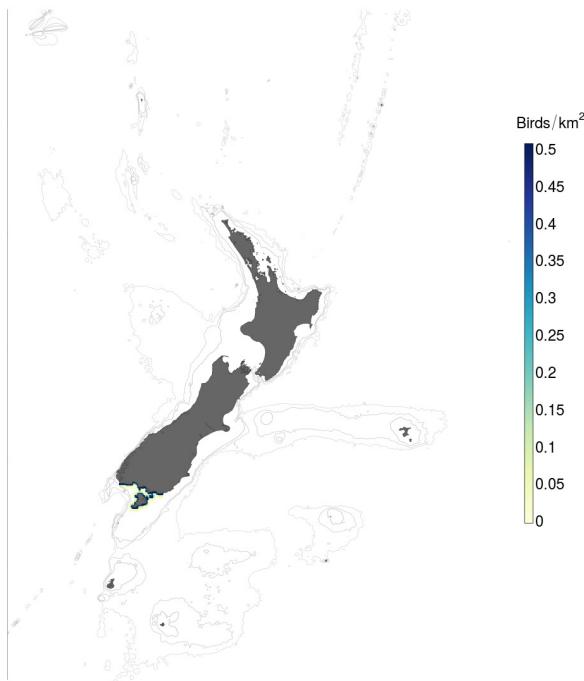

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.0–4.9 | Years |  |
| Age at first reproduction (from allometric model) | 3.2 | 2.3–4.4 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 85.8 | 76.2–92.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.5–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 1 310 | 1 230–1 400 | Pairs |  |
| Total population size (from raw input parameters) | 6 020 | 4 690–7 830 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.189 | 0.133–0.259 | |  |

1.61 Foveaux shag (*Leucocarbo stewarti*)

Table 121: Raw input data of population parameters of Foveaux shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------------|--|---------|
| Population (NZ) | 840 to 1 080 pairs [2016] | C. Lalas (pers. comm.) | High |
| Age at first reproduction | More than 3 years | R. Powlesland (pers. comm.) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 2 295 g | Myhrvold et al. (2015) | |
| Breeding period | August–March | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

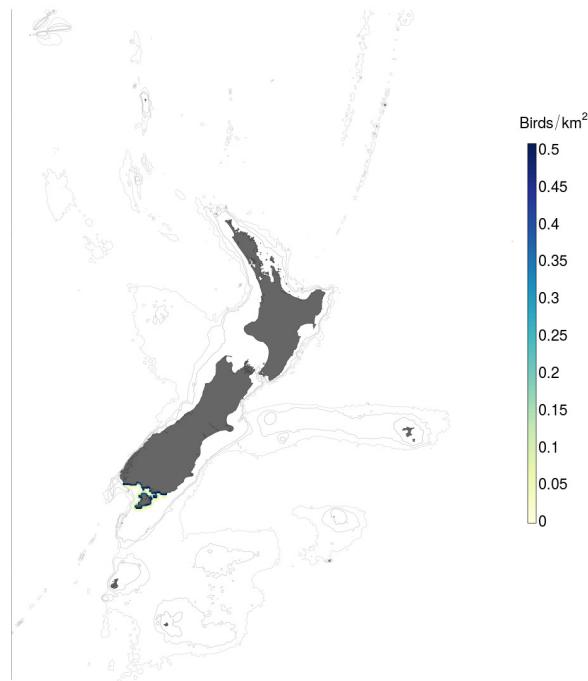

Figure 61: Relative density of Foveaux shag (*Leucocarbo stewarti*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 122: Derived values of population parameters of Foveaux shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

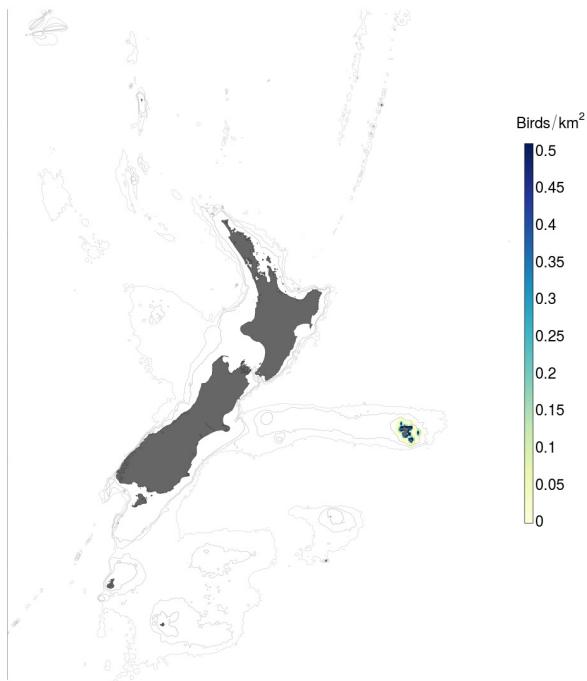

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.0–4.9 | Years |  |
| Age at first reproduction (from allometric model) | 3.2 | 2.4–4.4 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 85.9 | 77.2–92.3 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.1–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 955 | 845–1 070 | Pairs |  |
| Total population size (from raw input parameters) | 4 420 | 3 330–5 900 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.187 | 0.130–0.259 | |  |

1.62 Chatham Island shag (*Leucocarbo onslowi*)

Table 123: Raw input data of population parameters of Chatham Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|--|---------|
| Population () | 355 pairs [2011] | Debski et al. (2012) | High |
| Age at first reproduction | More than 3 years | R. Powlesland (pers. comm.) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 2 374 g | Myhrvold et al. (2015) | |
| Breeding period | September–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

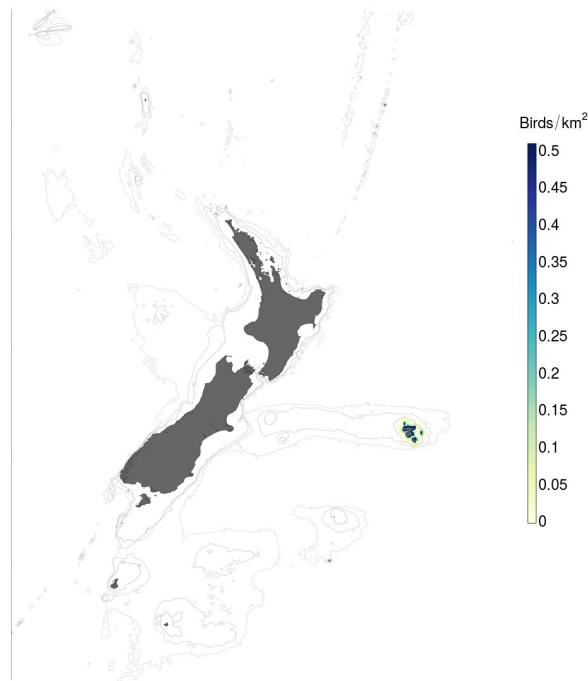

Figure 62: Relative density of Chatham Island shag (*Leucocarbo onslowi*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 124: Derived values of population parameters of Chatham Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

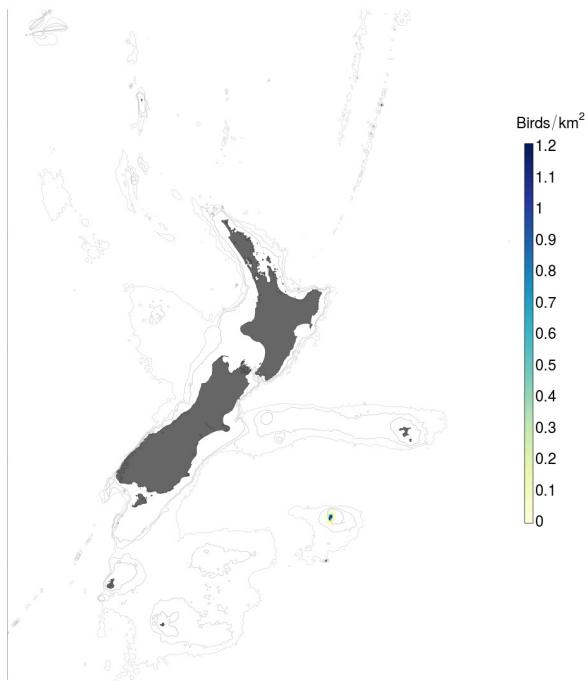

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.3 | 2.4–4.4 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 85.9 | 76.9–92.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.1 | 75.7–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 357 | 292–433 | Pairs |  |
| Total population size (from raw input parameters) | 1 620 | 1 180–2 200 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.186 | 0.132–0.259 | |  |

1.63 Bounty Island shag (*Leucocarbo ranfurlyi*)

Table 125: Raw input data of population parameters of Bounty Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|--|---------|
| Population (NZ) | 120 pairs [2005] | BirdLife International (2012) | Medium |
| Age at first reproduction | More than 3 years | R. Powlesland (pers. comm.) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 2 425 g | Myhrvold et al. (2015) | |
| Breeding period | October–December | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

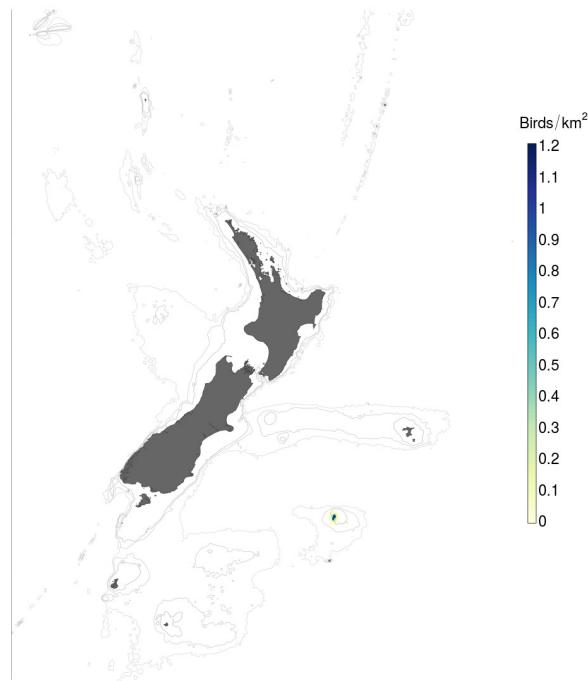

Figure 63: Relative density of Bounty Island shag (*Leucocarbo ranfurlyi*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 126: Derived values of population parameters of Bounty Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

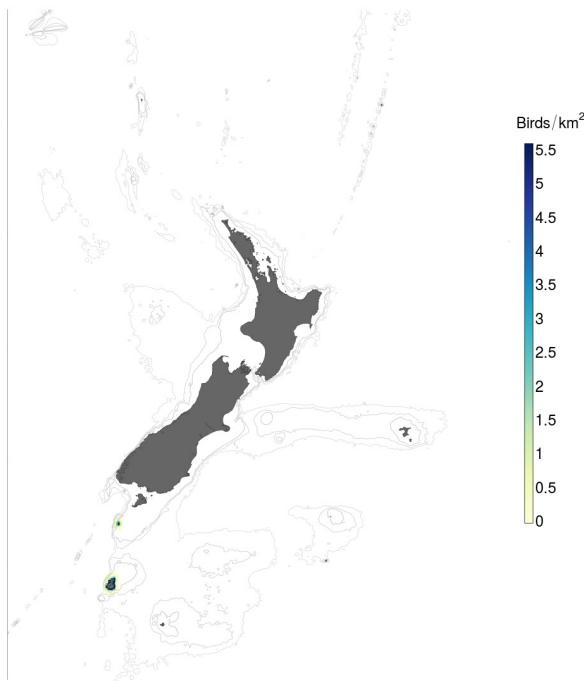

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.3 | 2.4–4.4 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 86.0 | 76.5–92.5 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 74.7–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 123 | 81–180 | Pairs |  |
| Total population size (from raw input parameters) | 562 | 350–856 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.185 | 0.128–0.259 | |  |

1.64 Auckland Island shag (*Leucocarbo colensoi*)

Table 127: Raw input data of population parameters of Auckland Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|------------------------------|--|---------|
| Population (NZ) | More than 1 366 pairs [2011] | BirdLife International (2012) | Poor |
| Age at first reproduction | More than 3 years | R. Powlesland (pers. comm.) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 1 919 g | Myhrvold et al. (2015) | |
| Breeding period | November–March | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

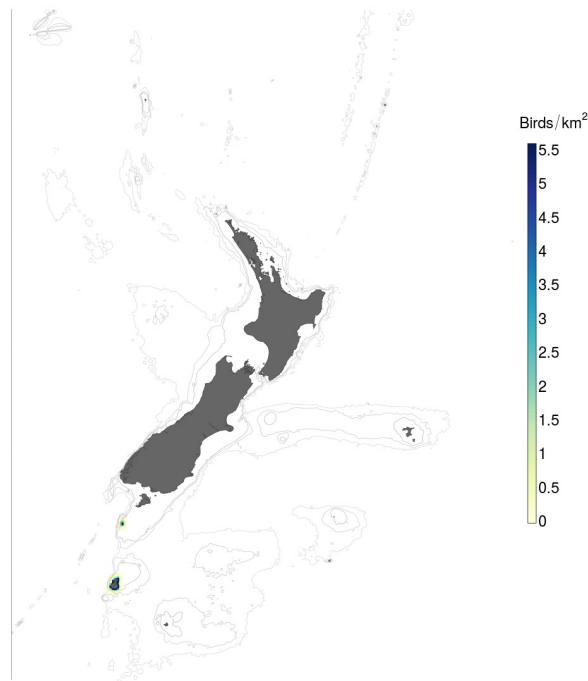

Figure 64: Relative density of Auckland Island shag (*Leucocarbo colensoi*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 128: Derived values of population parameters of Auckland Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

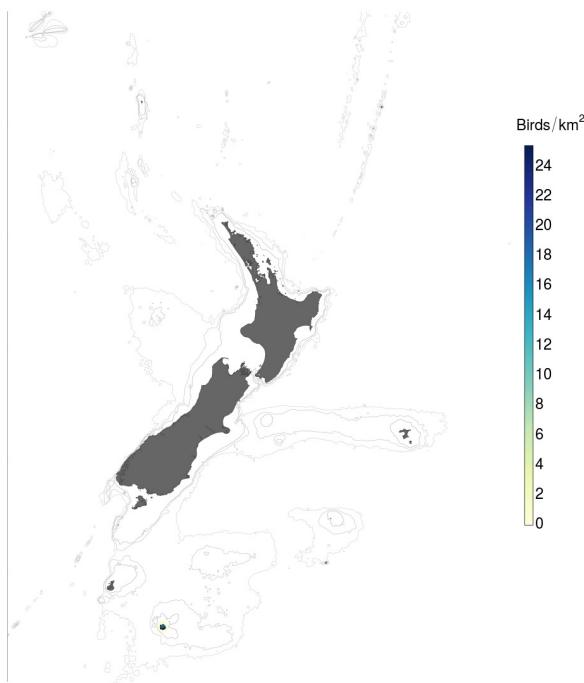

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|--------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.1 | 2.3–4.2 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 85.3 | 75.9–92.1 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.1 | 75.3–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 2 150 | 990–3 950 | Pairs |  |
| Total population size (from raw input parameters) | 9 530 | 4 450–18 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.199 | 0.140–0.274 | |  |

1.65 Campbell Island shag (*Leucocarbo campbelli*)

Table 129: Raw input data of population parameters of Campbell Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|--|---------|
| Population (NZ) | 2 000 pairs [1975] | BirdLife International (2012) | Poor |
| Age at first reproduction | More than 3 years | R. Powlesland (pers. comm.) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 1 858 g | Myhrvold et al. (2015) | |
| Breeding period | November–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

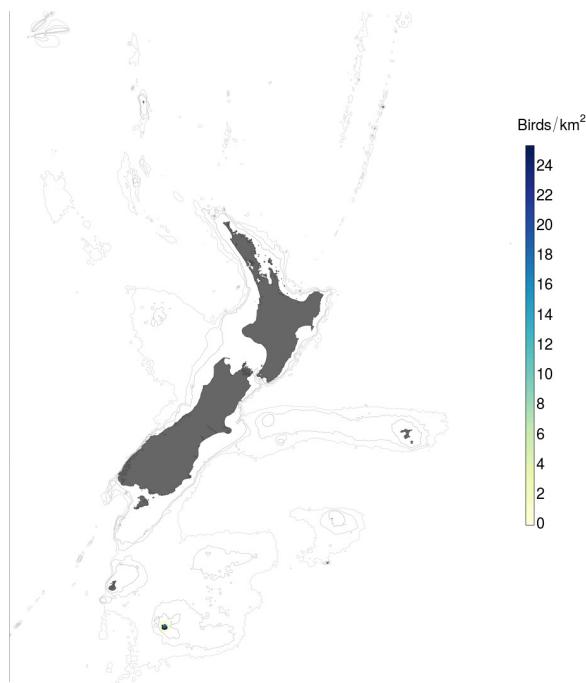

Figure 65: Relative density of Campbell Island shag (*Leucocarbo campbelli*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 130: Derived values of population parameters of Campbell Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|--------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.1–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.1 | 2.3–4.1 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 85.1 | 76.3–91.8 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.3–96.4 | % |  |
| Annual breeding pairs (from raw input parameters) | 2 110 | 1 100–3 660 | Pairs |  |
| Total population size (from raw input parameters) | 9 770 | 4 980–17 500 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.201 | 0.143–0.277 | |  |

1.66 Spotted shag (*Stictocarbo punctatus*)

Table 131: Raw input data of population parameters of spotted shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment.

| Parameter | Data | Reference | Quality |
|---------------------------|------------------------|--|---------|
| Population (NZ) | 10 000 to 30 000 pairs | Taylor (2000b) | Poor |
| Age at first reproduction | 2 years | Schreiber & Burger (2001) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 1 186 g | Myhrvold et al. (2015) | |
| Breeding period | All year | G. Taylor (pers. comm.) | |

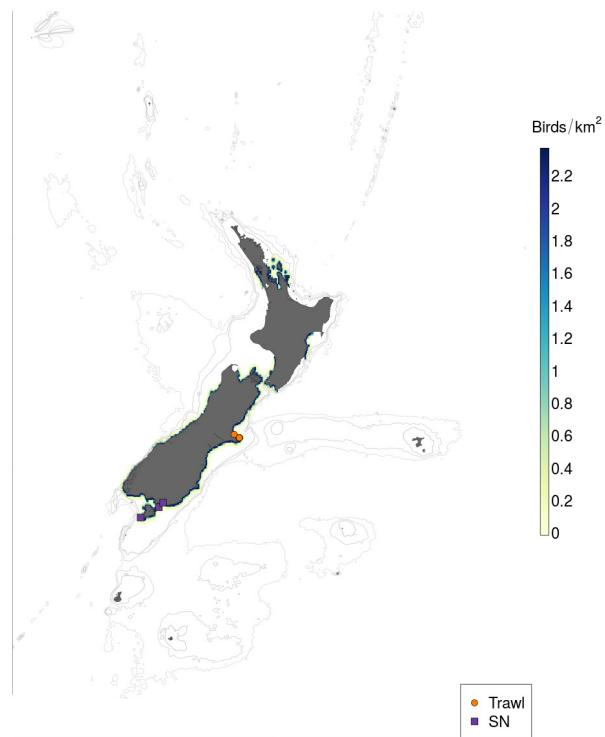

Figure 66: Relative density of spotted shag (*Stictocarbo punctatus*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in trawl and set-net (SN) fisheries.

Table 132: Derived values of population parameters of spotted shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

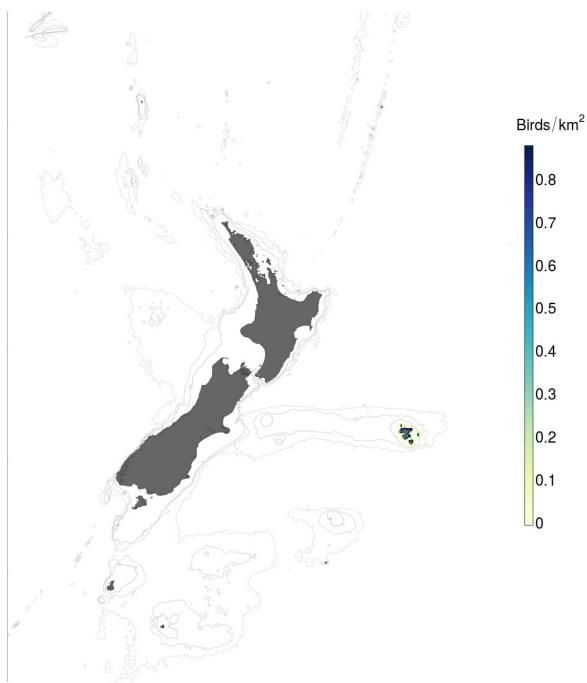

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|--------|----------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 2.0 | 1.0–2.9 | Years |  |
| Age at first reproduction (from allometric model) | 2.7 | 2.0–3.7 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 83.3 | 73.1–91.0 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.3–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 18 200 | 10 300–29 200 | Pairs |  |
| Total population size (from raw input parameters) | 63 600 | 34 900–108 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.233 | 0.160–0.330 | |  |

1.67 Pitt Island shag (*Stictocarbo featherstoni*)

Table 133: Raw input data of population parameters of Pitt Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|--------------------|--|---------|
| Population () | 388 pairs [2011] | Debski et al. (2012) | High |
| Age at first reproduction | More than 3 years | R. Powlesland (pers. comm.) | |
| Current survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Optimal survival rate | 87.8 (85.9–89.7) % | European shag as proxy; Harris et al. (1994) | |
| Body mass | 1 185 g | Myhrvold et al. (2015) | |
| Breeding period | September–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

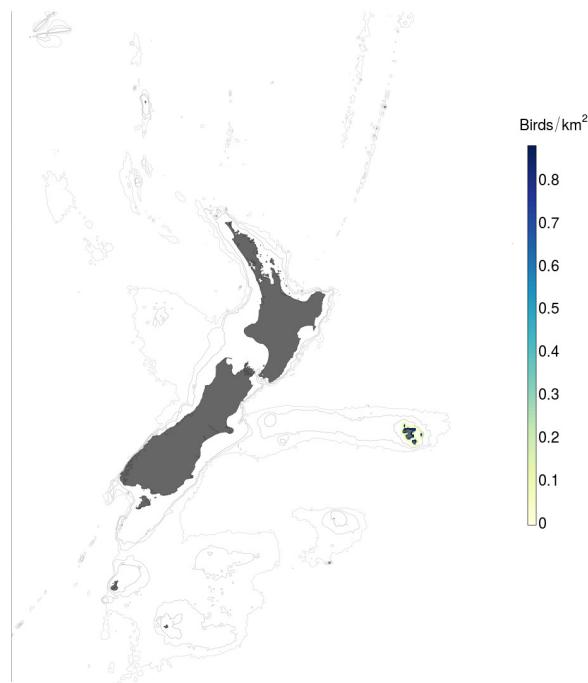

Figure 67: Relative density of Pitt Island shag (*Stictocarbo featherstoni*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 134: Derived values of population parameters of Pitt Island shag for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

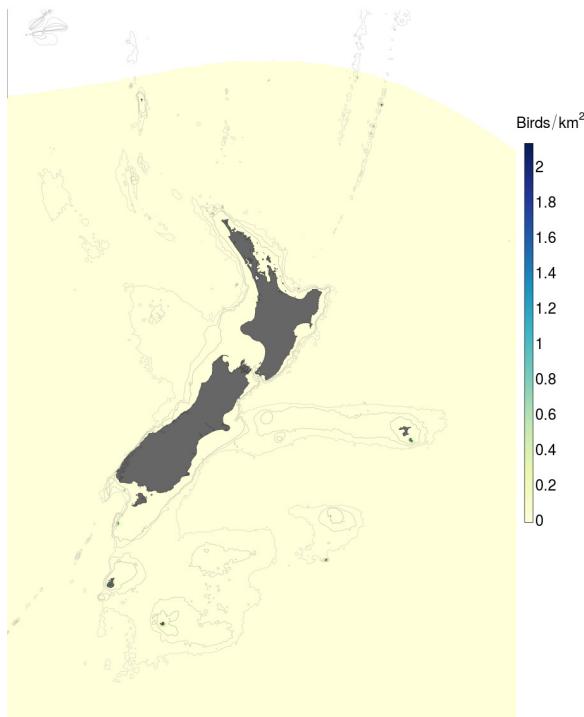

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.1–4.9 | Years |  |
| Age at first reproduction (from allometric model) | 2.7 | 2.0–3.7 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.8 | 86.0–89.6 | % |  |
| Optimal adult annual survival rate (from allometric model) | 83.4 | 73.2–90.8 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 75.5–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 391 | 319–475 | Pairs |  |
| Total population size (from raw input parameters) | 1 790 | 1 310–2 460 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.233 | 0.159–0.326 | |  |

1.68 Subantarctic skua (*Catharacta antarctica lönbergi*)

Table 135: Raw input data of population parameters of subantarctic skua for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---|-------------------------|---------|
| Population (NZ) | 450 to 470 pairs | Wilson (2006) | |
| Age at first reproduction | 8.03 ± 0.21 years ($N = 96$) [1996] | Young (1998) | High |
| Current survival rate | 93.8 (91–97) % [1965] | Wood (1971) | Medium |
| Optimal survival rate | 93.8 (91–97) % [1965] | Wood (1971) | Medium |
| Body mass | 1 725 g | Myhrvold et al. (2015) | |
| Breeding period | September–February | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 50% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

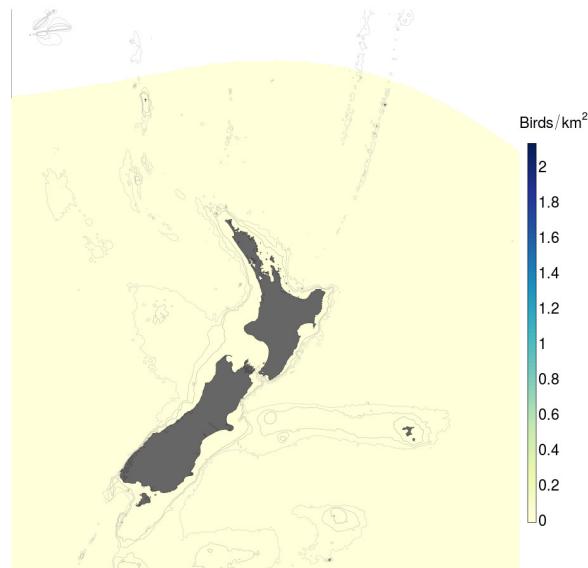

Figure 68: Relative density of subantarctic skua (*Catharacta antarctica lönbergi*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 136: Derived values of population parameters of subantarctic skua for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

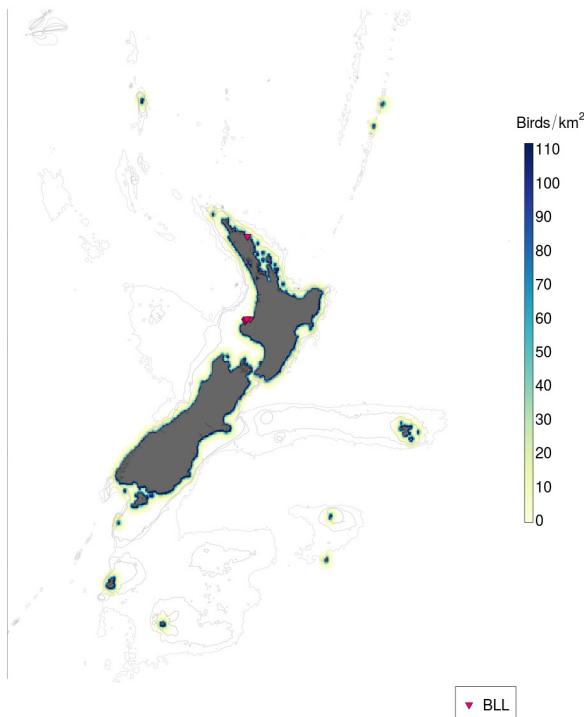

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 8.0 | 7.6–8.4 | Years |  |
| Age at first reproduction (from allometric model) | 5.8 | 4.4–7.4 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 94.1 | 91.1–96.9 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 94.0 | 91.2–96.9 | % |  |
| Optimal adult annual survival rate (from allometric model) | 84.3 | 75.7–91.0 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.9 | 75.0–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 460 | 451–470 | Pairs |  |
| Total population size (from raw input parameters) | 2 220 | 1 640–3 120 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.120 | 0.092–0.156 | |  |

1.69 Southern black-backed gull (*Larus dominicanus dominicanus*)

Table 137: Raw input data of population parameters of southern black-backed gull for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------------|---------------------------|---------|
| Population (NZ) | More than 1 000 000 pairs | Taylor (2000b) | |
| Age at first reproduction | 4 years | Schreiber & Burger (2001) | |
| Current survival rate | 81 % | Schreiber & Burger (2001) | |
| Optimal survival rate | 81 % | Schreiber & Burger (2001) | |
| Body mass | 966 g | Myhrvold et al. (2015) | |
| Breeding period | September–March | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

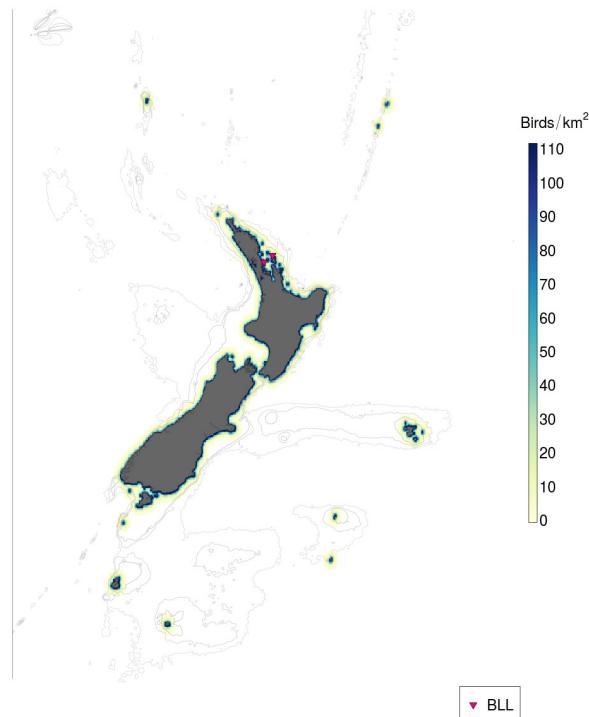

Figure 69: Relative density of southern black-backed gull (*Larus dominicanus dominicanus*). Also shown are incidental captures recorded by observers between the 2006–07 and 2014–15 fishing years in bottom-longline (BLL) fisheries.

Table 138: Derived values of population parameters of southern black-backed gull for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

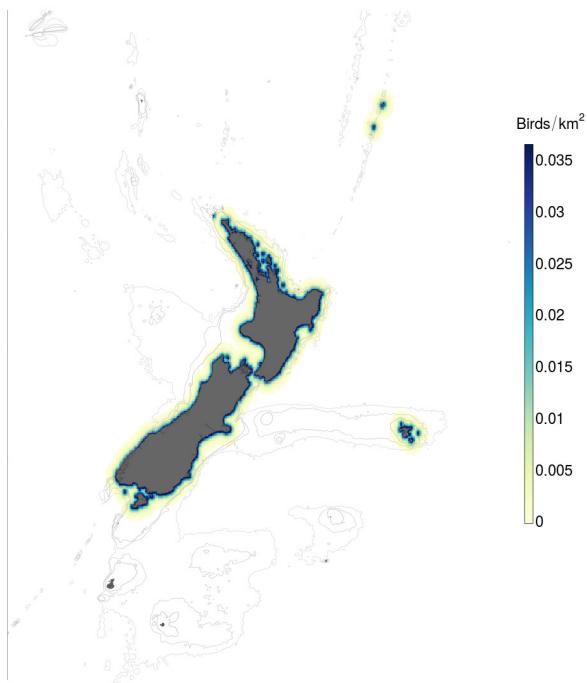

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-----------|----------------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.1–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 5.0 | 3.8–6.3 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 80.8 | 74.3–86.1 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 80.8 | 74.5–86.2 | % |  |
| Optimal adult annual survival rate (from allometric model) | 82.0 | 73.1–89.6 | % |  |
| Proportion of adults breeding (from raw input parameters) | 88.8 | 75.0–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 1 570 000 | 728 000–2 900 000 | Pairs |  |
| Total population size (from raw input parameters) | 9 400 000 | 4 030 000–19 200 000 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.142 | 0.108–0.181 | |  |

1.70 Caspian tern (*Hydroprogne caspia*)

Table 139: Raw input data of population parameters of Caspian tern for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|---------------------------|--|---------|
| Population (NZ) | 1 000 pairs [1992] | Taylor (2000b) | Medium |
| Age at first reproduction | 2 to 4 years | Schreiber & Burger (2001) | |
| Current survival rate | 87 to 91 % 89 % [1980] | Schreiber & Burger (2001) Gill & Mewaldt (1983) | |
| Optimal survival rate | 87 to 91 % 89 % [1980] | Schreiber & Burger (2001) Gill & Mewaldt (1983) | |
| Body mass | 648 g | Myhrvold et al. (2015) | |
| Breeding period | September–January | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

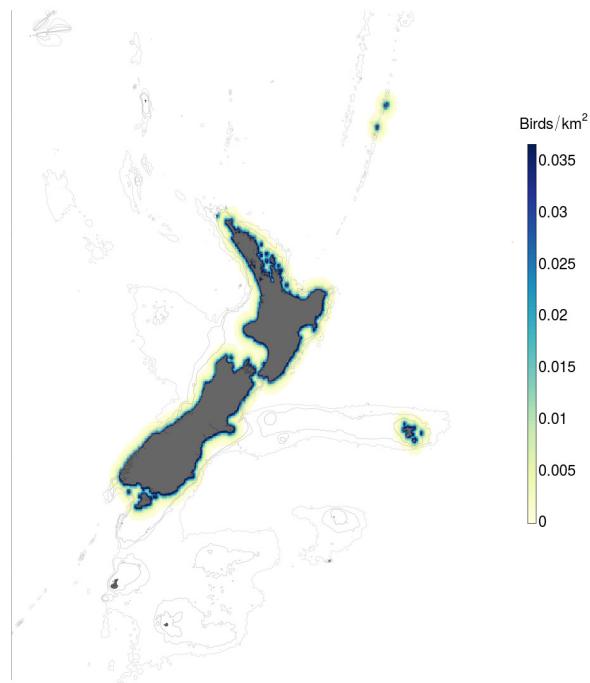

Figure 70: Relative density of Caspian tern (*Hydroprogne caspia*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 140: Derived values of population parameters of Caspian tern for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

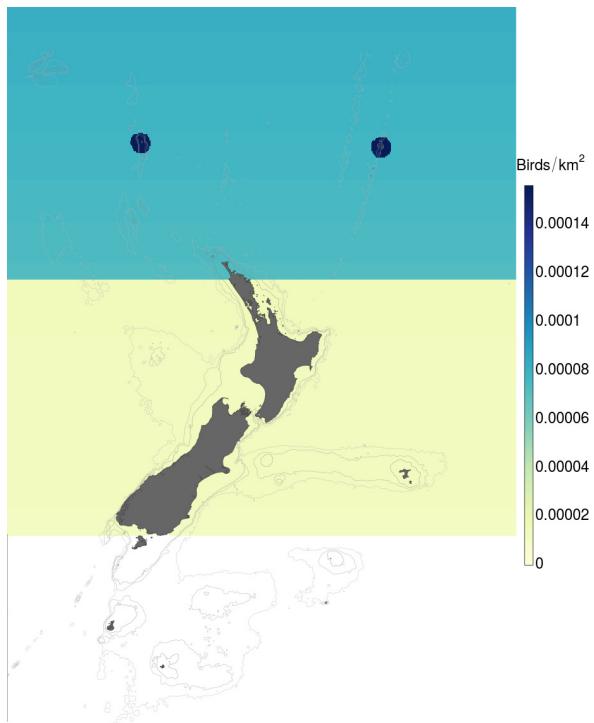

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 3.0 | 2.0–4.0 | Years |  |
| Age at first reproduction (from allometric model) | 4.5 | 3.4–5.7 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 87.7 | 82.0–93.3 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 87.6 | 81.9–93.3 | % |  |
| Optimal adult annual survival rate (from allometric model) | 80.1 | 69.6–88.4 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 74.6–96.5 | % |  |
| Annual breeding pairs (from raw input parameters) | 1 020 | 692–1 480 | Pairs |  |
| Total population size (from raw input parameters) | 4 220 | 2 570–6 670 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.161 | 0.120–0.211 | |  |

1.71 White tern (*Gygis alba candida*)

Table 141: Raw input data of population parameters of white tern for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters, including the data source and an assigned quality ranking. Years in square parentheses indicate time of population assessment. “Relative non-breeding pop.” refers to the population in New Zealand outside the breeding season relative to the population during the breeding season.

| Parameter | Data | Reference | Quality |
|----------------------------|-----------------|--|---------|
| Population (NZ) | 60 to 100 pairs | Taylor (2000b) | Poor |
| Age at first reproduction | 3 to 5 years | Schreiber & Burger (2001) | |
| Current survival rate | 78 to 83 % | Bridled tern as proxy; Schreiber & Burger (2001) | |
| Optimal survival rate | 78 to 83 % | Bridled tern as proxy; Schreiber & Burger (2001) | |
| Body mass | 232 g | Myhrvold et al. (2015) | |
| Breeding period | September–April | G. Taylor (pers. comm.) | |
| Relative non-breeding pop. | 100% | G. Taylor (pers. comm.) | |

(a) Breeding season distribution

(b) Non-breeding season distribution

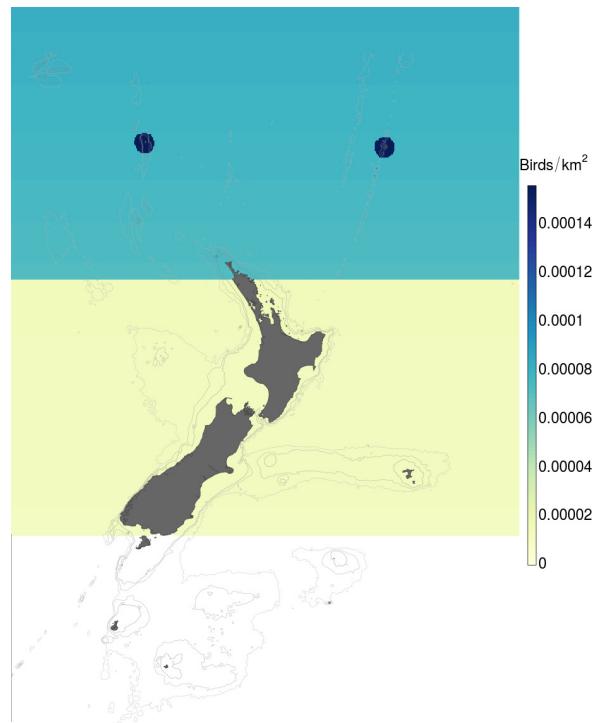

Figure 71: Relative density of white tern (*Gygis alba candida*). No incidental capture was recorded by observers between the 2006–07 and 2014–15 fishing years in trawl, surface-longline (SLL), bottom-longline (BLL), and set-net (SN) fisheries.

Table 142: Derived values of population parameters of white tern for the assessment of the risk of commercial fisheries to seabirds in New Zealand waters. For the density distribution of each parameter, the central red line indicates the mean, outer blue lines indicate the 2.5 and 97.5 percentiles.

| Parameter | Mean | 95% c.i. | Unit | Distribution |
|--|-------|-------------|-------------|---|
| Age at first reproduction (from raw input parameters) | 4.0 | 3.0–5.0 | Years |  |
| Age at first reproduction (from allometric model) | 3.5 | 2.6–4.5 | Years |  |
| Current adult annual survival rate (from raw input parameters) | 80.5 | 78.1–82.9 | % |  |
| Optimal adult annual survival rate (from raw input parameters) | 80.5 | 78.1–82.9 | % |  |
| Optimal adult annual survival rate (from allometric model) | 74.5 | 60.6–85.8 | % |  |
| Proportion of adults breeding (from raw input parameters) | 89.0 | 75.7–96.3 | % |  |
| Annual breeding pairs (from raw input parameters) | 78 | 61–99 | Pairs |  |
| Total population size (from raw input parameters) | 480 | 311–717 | Individuals |  |
| Maximum net productivity rate r_{\max} | 0.221 | 0.161–0.297 | |  |
